Your explanation is very clear and I will appreciate it if you would discuss the cw timing issue with Jim. It would be very nice if a parameter "CW_Delay" could be placed in the .quisk_conf.py file with a range of say 0 to 50 mSec. This will allow the operator to set the timing so that inter letter spaces up to inter word spaces if desired do not operate the relay. On full break-in cw it is usual to have the radio go to receive on word pauses or even letter pauses.

I had a problem with my softrock where the RF was applied at the same time as the relay changeover signal which meant the RF was applied to the Linear while the relay contacts were traveling and the swr protection saw an open circuit antenna and consequently shut down the rig. I wonder if there is a settling period for the relays to changeover before RF is applied. Conversely on receive the RF needs to be stopped from the TX before the relays release. I suspect the mechanical delay of the relay will hold the contacts closed even if RF and relay release signal occur at the same time. Probably these points have already been considered but I bring it to your attention just in case.

It is a simple task to pulse stretch the RX_ACTIVE signal in hardware if the software modification is messy.

I could see that Preselector X2, Pin8: CCTX: was a level converter signal but had no idea of its purpose. For level conversion on my preselector i am using the 74LVC4245 chip which is a 3.3 volt to 5 volt octal converter but of course will need to do the same as you to go the other direction.

Danke sehr.

Topic: 1002 Message: 1015

Hi Helmot,

Again thank you for the information. I now understand all that you have done and admire your clever design.

If you go down the road of pulse stretching with software the signal to preselector X2 pin 6 via Quisk you may find these calculations useful to you. You will also see that my guess of 0 to 50 mSec was way too small.

International Morse code is composed of five elements:

1. short mark, dot or 'dit' (·) ☐ 'dot duration' is one unit long
2. longer mark, dash or 'dah' (☐) ☐ three units long
3. inter-element gap ☐ one dot duration or one unit long
4. short gap (between letters) ☐ three units long
5. medium gap (between words) ☐ seven units long

Based upon a 50 dot duration standard word such as PARIS, the time for one dot duration or one unit can be computed by the formula:

T = 1200 / Words Per Minute
or
T = 6000 / Characters Per Minute

Hence at 10 WPM
T = 1200 / 10 = 120 mSec duration for one dot
and at 50 WPM
T = 1200 / 30 = 40 mSec duration for one dot

If you want to hold the relay over the gap between letters at nn WPM the delay needs to be dot time * 3 plus say 10 mSec for safety.
at 10 WPM = 120 * 3 + 10 = 370 mSec
at 30 WPM = 40 * 3 + 10 = 130 mSec

For holding between words needs to be dot time * 7 plus an allowance.
at 10 WPM = 120 * 7 + 10 = 850 mSec
at 30 WPM = 40 * 7 + 10 = 290 mSec

I would suggest a range of 0 to 900 mSec would cover practical speeds.

1017. Adc experiments

Yahoo group: n2adr-sdr
Date: 2013-05-24 13:50:11 UTC
From: yannminder
Topic: 1017 Message: 1017

After reading the FA article about the Hiqsdr, i decided to start to experiment with this project. As i don't like when it's to easy, i decided to use this receiver as a good (very good) basis and adapt it to my own version. I just finished the adc frontend using ltc2165 adc.
The first experiments used a logic analyzer to grab the data at 122.88Msps then compute the fft with matlab. The Adc clock is the same used by the Hiqsdr because his jitter and phase noise are excellents.
My question is : is there anyone who try the same thing or get the raw data from the adc through the fpga ?
This because i get some inconsistent results in ffts displays.
I applied different kind of windowing but the result is about the same : spectral leakage on the output, changing with time. For example, i get a perfect measurement of my signal generator (ifr2025) with SFDR and very good noise floor (-110dbm or better) in line with LTC2165 datasheet. On the next runs i can see the spectral lines widening as if the jitter on the adc clock degrades. I tried different sources as wenzel ocxo or simple quartz oscillators an get the same behaviour.
I found a microwave journal article about this phenomena (when the input signal periods are not an integer number in the sample file) but cannot adjust my input signal frequency relative to the adc reference clock. I'm currently building a pll to lock the crystek cvhd oscillator to an external 10MHz reference. On the same pcb i buffer the 122M on different outputs (adc/dac/fpga) with an ultra low jitter buffer (lmk0105). More to come...

Hi! In my latest project, I used ADS6145 and SI59X-PROG-Lvds 122.880 generanor.Thees work very good. I got -128.5dB on S-metr in 200 Herz bandwith .
But when I used LTC2208-14, I had unexplained noise -60dB ,which decreased when touched to the body of ADC.
See foto in my folder.
Give foto your project.

Best regards.

1019. Quisk 3.6.10 filter bandwidths

Yahoo group: n2adr-sdr
Date: 2013-06-07 12:12:05 UTC
From: g0izm
Topic: 1019 Message: 1019

Hello All

I'm using Quisk 3.6.10 and noticed that whatever mode was selected the rightmost filter button was always 1000Hz, regardless of whatever I put in .quisk_conf.py.

I (seemingly) fixed it via a small change in quisk.py:

```
$ diff quisk.py quisk1.py
2601c2601
< for i in range(0, len(buttons) - 1):
---
> for i in range(0, len(buttons)):
```

This doesn't seem to break anything for me & all the filter bandwidths are now available as expected.

Hi g0izm,

I (seemingly) fixed it via a small change in quisk.py:

```
$ diff quisk.py quisk1.py
2601c2601
< for i in range(0, len(buttons) - 1):
---
> for i in range(0, len(buttons)):
```

THat was not a good idea, the rightmost filter button has a special functionality.
If you klick this button with the right mouse button , a slider opens and you can assign a selectable bandwith to the this button.

Thanks (I now know another feature to play with!)

Looking at the files, the 1000Hz value I was seeing was the default value in my .quisk_init.pkl (which of course I'd never changed). The effect of the mod I made was to overwrite that with the value in quisk_conf_defaults.py. (Does each mode's last filter value - e.g 3000 for CW - in that file get used anywhere normally?)

Incidentally the slider still works in either case so there's seemingly no functionality loss with that.

1022. Testing Toroids with an LCR or?

Yahoo group: n2adr-sdr
Date: 2013-06-16 19:37:09 UTC
From: wa9sdj
Topic: 1022 Message: 1022

To further my education I'd like to do some testing on my toroids by measuring the inductance, comparing what it should be. I'm considering to purchase a LCR meter (I do have an MFJ-259B and an AIM-4170C) but am not completely sure how to properly test? Is there a standard frequency these should be measured at or? Anyone with time to share their experience?

Many thanks,

73
Andy

Topic: 1022 Message: 1023

Hi Andy,

best is, to measure the toroids with an LCR meter.
Inductance of the wound toroids differ from winding strength, exact diameter of wire
and toroid material tolerances.
The windiwngs given in the table can be only a thumb-of-rule.
But keep in mind, that a toroid only can have even windings!
That means that you maybe nevr will get the "exact" inductance especially
if you have low winding count. one more will be too high, one less too low.
In this situation choose one more, it it always easier to remove a windng
than to make one more ;-)
You should try to be near 5% inductance tolerance and you will get
perfect filter results. But only wind "blind" awithout measureing the inductance
will give most of the time worse filter behaviour.

To measure inductance, theere are many LCR meters on the market.
LCR-Meter from AAA is a cheap choice, but somtimes ot very accurate,
a very fine and affordable (calibrated !) instrument is the one we use here
from Agilent, the 1733C LCR Meter. It costs around 330 EURO but its worth every cent!
We are measuring inductances @ a measuring frequency of 100kHz.

http://www.home.agilent.com/en/pd-1984437-pn-U1733C/100hz-120hz-1khz-10khz-100khz-handheld-lcr-meter?nid=-34196.980702&cc=DE&lc=ger

I ended up buying a Hameg HM8118, I'm quite anxious for it to arrive!

Thanks again for the help.

1026. Quisk Version 3.6.11 July 2013

Yahoo group: n2adr-sdr
Date: 2013-07-01 16:47:47 UTC
From: jimahlstrom
Topic: 1026 Message: 1026

I increased the size of the SoftRock status line.

You can now change frequency by left clicking on the digits in the frequency display. Click on the upper part of a digit to increase it, and the lower part to decrease it.

I added some GREAT features from Christof, DJ4CM:
Symbols for buttons. But you can change back to text with use_unicode_symbols = False.
Two new buttons for direct entry and recall of items on the favorites screen.
A new window to display saved stations, favorites and dx cluster data below the frequency axis.
A feature to query a dx cluster using telnet, and display the stations.
The symbols use Unicode, and were tested on Linux and Windows, and on computers in Germany and the USA. But if your Windows does not support Unicode, you will need to add use_unicode_symbols = False. Read quisk_conf_defaults.py (as usual), and look for quisk_typeface, btn_text_, use_unicode_symbols, sym_stat_, station_display_lines, and dxClHost to see how to use these features by Christof.

Hi,

since a few days i own a ARM based Cubieboard. It is a bit more powerful than a Raspberry Pi and has more memory and interfaces. I installed the Raspbian debian based Linux and tried to get Quisk working for a test. Compiling was not difficult. First i always got the GUI beeing inoperational at all but then i found that i really need .quisk_conf.py in the home directory. I simply ignored that.
After having the audio interface configured to hw:1 and the config file at the correct place i get pieces of audio out of the speakers.
Unfortunately also tons of error messages, all the same like:
"Failure in quisk.c in integer decimation"
?

regards
Mario, DH5YM

After having pressed the send button two things came to my mind:
1) i set the sample rate in the config to 44100
2) 44100 is not multiple of 8000 ;)

after changing to 48000 quisk works on the arm machine.

Hi,

i tried with my Cubieboard with A10 processor. Unfortunately it does not run perfectly even with 48kSpl/s. Probably the version with dual core processor runs better because you have 1 core for Quisk only.
I would be interested in the practical results with Odroid.

1032. Quisk Version 3.6.12 August 2013

Yahoo group: n2adr-sdr
Date: 2013-08-01 19:08:21 UTC
From: jimahlstrom
Topic: 1032 Message: 1032

I fixed a bug that produced slight distortion in the transmitted signal. I added the Enum type to the mixer control "mixer_settings[]". Be sure to use a Python float if you want a decimal fraction 0.0 to 1.0; that is, use "1.0" for 100%, not "1".

The config file now defines hot keys that will press the PTT button when the keys are pressed.

I added a new tab to the Config Screen for testing transmit audio. You can record and play back the processed microphone output to hear what it sounds like. I plan to add audio controls to this screen in a future release. I think the record/playback is more useful than a simple loopback because I find it difficult to talk and listen at the same time.

Hi Jim! Thank you for you job.

I noticed that preselector switches only when you press the band buttons
and nonswitches when setting frequency in the window or with arrows.
This is problem for TX PA for the correct choice of LPF.
I would be happy, If can set frequency range for each value of preselector but not band.
Similarly, this is necessary for tx_level.

I see the problem , Quisk doesn't save size of graph in the waterfall mode. Every time,
size = 0. (windows 8.1)

And,I would be like increase resolution of waterfall.

Thank you!

1034. Problem -- 15m BPF permanently selected

From: Sid Boyce
Topic: 1034 Message: 1034

First I checked J4-pin 5 to make sure there was no short to GND.

IC3 pin 16 measured on the DVM is 0V.
IC3 pin 1 and IC9 pin 7 also 0V.
Replaced IC3 but problem still exists.

From Presel_HiQSDR_BOT.JPG

IC3 (Bottom left next to relays) IC8 (Right of IC3
next to edge of board)

IC4 IC9 (above IC8)

GHiQTRX_Presel_V26_BOT.pdf is different.

Please confirm which is correct.
73 ... Sid.

If I am on 40 meters, and I enter 14.1 in the frequency window and hit enter, the band button
switches to 20 meters. Please check if this happens for you. If the band button changes, then
the preselector should change too. If the band button does not change, then check the configuration
file for BandEdge[], as this controls the frequency definitions for each band, and must be correct.

If the band button changes, and the preselector does not change, check HiQSDR_BandDict[] in the config file.

> I see the problem , Quisk doesn't save size of graph in the waterfall mode. Every time, size = 0. (windows 8.1)

The initial size of the waterfall graph is set with waterfall_graph_size in your config file.

> And,I would be like increase resolution of waterfall.

I do not know what you mean by this. Waterfall colors are set with the sliders Ys and Yz for scale and zero.

If I am on 40m and enter in window 13.980, the band button not switch, and then klick on graph with mouse 14.100 , the band not switch too.
But I already understand how to configure this.

> > And,I would be like increase resolution of waterfall.
>
> I do not know what you mean by this. Waterfall colors are set with the sliders Ys and Yz for scale and zero.
>
I set the fft_size_multiplier = 15 and FFT Number of point was 19200
and I see pixels on the waterfall. It's not bad! But I think the quality could be better.

Thank you!

1037. Problems with Quisk/Ubuntu after "Update"

Yahoo group: n2adr-sdr
Date: 2013-08-05 04:43:48 UTC
From: wb4jfi
Topic: 1037 Message: 1037

OK, so my bench laptop wanted to do updates on a whole bunch of stuff. Fine, I think, and let it do its thing. Stupid move. This has been a rather poor week in the shack, and I should have gone to see a movie instead.

I had Quisk 3.6.11 working fine for both the SDRIQ and the Charleston Rx1, and had been working on a different computer fixing the Windows version of Quisk for 3.6.11, and then 3.6.12 when it came out.

I then added 3.6.12 (a clean copy) to the Bench laptop, and built it. Darned if I don't now get errors at runtime. If I do a "sudo ./quisk.py", I get an error: undefined symbol PyCapsule_New. If I do a "python quisk.py", I get an error: import wxversion, no module named wxversion. But, if I do a sudo apt-get install python-wxversion, it says that it's there. Typing just python shows that I'm set to Python 2.7.5.

So, previously built Quisk 3.6.11 still ran, but 3.6.12 would not. As a test, I rebuilt 3.6.11, and now IT no longer works, exhibiting the same results.

However, Quisk 3.5.11 still runs fine on the same machine, even after rebuilding it.

I HATE when this happens. Anybody have any ideas? I've looked over the web without much luck.
Thanks and 73, Terry, WB4JFI

Hello Terry,

The PyCapsule interface was introduced several versions ago, so perhaps it is not in Quisk 3.5. Anyway, PyCapsule is in Python 2.7, and 3.1, but not in 3.0. So it is possible that you are using 3.0 somehow. Try "python" in a terminal window to see the version. Then try "python quisk.py"; it is possible that "./quisk.py" uses Python 3.0.

Another possibility is that your wx version is for 3.x. You must have a recent wx for Python 2.7. Try "python" (validate 2.7) then "import wxversion" ; this must work. Also "import wx", and "print wx" might help.

I think you have incompatible python and wx. My Python is 2.7.3 and wx prints as /usr/lib/python2.7/dist-packages/wx-2.8-gtk2-unicode/wx/__init__.pyc. Note that wx is in the Python2.7 library.

Topic: 1037 Message: 1039

Thanks for this Jim. Your info pointed me in sort of the right direction. I didn't want to bother you on what was probably stupidity on my end. This hasn't been a great week and I've been feeling a little under the weather, taking some funny prescript medicine. I can feel that the brain is not firing on all cylinders! Not that it ever has...

It turns out that I was probably running Python 2.6 in the past, as I only have directories for Python 2.6 and 3.1 in /usr/lib. But, usr/local/bin only has Ptyhon 2.7 in it, plus a link from "python" to python2.7 in that same directory. So, somehow 2.7.5 got installed, and a link created that messed things up. I killed the link entry, and now Python 2.6 runs as the default (from where I don't know).

So, I can now successfully build and run Quisk 3.6.11 again, 3.6.12 builds, but I get errors when I try to run it with the Charleston receiver. Or, it will draw most of the Quisk screen, then stop working, depending on how I run it. I will try it with the SDR-IQ later tonight. In the next couple of days I will also try these both out with my HiQSDR as well.

Thanks again for all your help. I will let you know of my progress.
73, Terry, WB4JFI

So it is possible that you are using 3.0 somehow. Try "python" in a terminal window to see the version. Then try "python quisk.py"; it is possible that "./quisk.py" uses Python 3.0.
>
> Another possibility is that your wx version is for 3.x. You must have a recent wx for Python 2.7. Try "python" (validate 2.7) then "import wxversion" ; this must work. Also "import wx", and "print wx" might help.
>
> I think you have incompatible python and wx. My Python is 2.7.3 and wx prints as /usr/lib/python2.7/dist-packages/wx-2.8-gtk2-unicode/wx/__init__.pyc. Note that wx is in the Python2.7 library.

Topic: 1041 Message: 1041

Hi people !
I make a small program for connecting HiQSDR as SDR-IP to another programs. This work with SDR-RADIO V 1.5 and SDR-CONSOLE V2.0
(tested) and must work with another programs.
It has a problem with sound quality because of oversampling but this maybe interesting as toy.

Goodluck!

Late reply, I had problems with getting mail to my g3vbv ID and only got it fixed last night - thousands and thousands of emails flooded in.

Mario, I had the same problem with quisk and Jim suggested that video processing was the hog.

With the ODROID-X and the mali400 video driver which takes care of video processing, the problem went away with USB sound cards but as Mike wrote here, the hardkernel support for the max98090 sound chip on the ODROID is useless and it would probably be a huge job touching many files if they backported max98090 support from the mainline kernel.

Still burns me that they have not addressed that .... Its WAY far less work to back port the max98090 than the work put forth to make the Mali400 Odroid into a working GAME CONSOLE !!!!!

Sorry -- didnt quite belong here in this forum .... the OdroidX would be a great SDR processing board -- IF the onboard 96K 32Bit codec was working properly !!!!

The importance of such issues and impact on SDR is not understood by most of mainstream.

Typical was my request for VirtualBox to support 2 sound cards. I only got one reply asking what I needed 2 sound cards for. I explained why but never had a reply to that.

That the Linux kernel has from very early included hamradio support was mainly due to Linus' lieutenant Alan Cox and also significant contributions from Jonathon Naylor now of Ubuntu.

That precedent meant that Alex Lee (9V1AL) had no trouble in getting UAC2 support into the kernel.

Back in the day when internet speeds topped out at 96KBps, our Linux hamradio group including Alan, would meet in a school monthly with our PC's, 10 MBps cables strewn across the floor so that code could be exchanged. We had a very active UK Linux hamradio TCP/IP group that mimicked the internet, e.g leave for work in the morning and return home in the evening with email and news (comp.os.linux and other hamradio groups) sitting on our PC's all done over our radio networks.

Hi rolin,

nice program, but my test with cutesdr V1.11 was not successful.
Is the source code available ?

Hello, rolin,

translation seems to work, showing varying conversion samples/s rates. But then: Any hints as to the 'network settings' (adress and port number) in the SDR Console 2.0?

1048. Quisk SDR on Linux Mint 14

Yahoo group: n2adr-sdr
Date: 2013-08-22 00:44:36 UTC
From: kk4huu
Topic: 1048 Message: 1048

(Also posted on linuxhams group)

I am trying to get my Softrock Ensemble RXTX working with Quisk (compiled 3.6.12 for 64 bit) and Fldigi on Linux Mint 14, and I am not having any luck.

I can 'listen' to PSK31 QSOs with the RXTX talking to HDSDR and Fldigi on Win7 on my dual-booted HP Envy 17 3270nr, so I know that at least my RXTX is receiving. However, I cannot get anything useful on Mint, which I prefer over Win7.

The problem seems to be with the audio setup. All I am getting is -90dB to -120dB of background noise showing up on Quisk and output through the speakers (which should not be happening).

My .quisk_conf.py has the following enabled lines:

```
from softrock import hardware_usb as quisk_hardware
from softrock import widgets_tx as quisk_widgets

usb_vendor_id = 0x16c0
usb_product_id = 0x05dc
softrock_model = "RxTxEnsemble"

key_poll_msec = 0

sample_rate = 48000

name_of_sound_capt = "hw:0,0"
name_of_sound_play = name_of_sound_capt

#Added Digital Loopback for fldigi
digital_input_name = "hw:Loopback,0"
digital_output_name = digital_input_name
```

list of arecord and aplay:

```

Attachments: 1 described; binary payloads are missing from this source WARC

I haven't looked at running fldigi under quisk, I have only used fldigi standalone with 2 sound cards, the same as I used for AM/CW/SSB/FM.

In the quisk documentation there is a description of what must be configured for digital modes.

1050. Re: Quisk SDR on Linux Mint 14

Yahoo group: n2adr-sdr
Date: 2013-08-23 17:37:36 UTC
From: kk4huu
Topic: 1048 Message: 1050

Sid,

Thanks for the reply.

The digital_input_name and digital_output_name lines that specify the loopback in my .quisk_config.py should act like a virtual audio cable between quisk and fldigi. (There is some command line stuff outside of quisk needed to set up the loopback.)

My problem is between the RXTX and quisk, not quisk and fldigi.

Bobby G

This is the ~/.quisk_conf.py that I used with the RXTX when I had a working one. You'll have to change the sound card designations - 2 needed for the RXTX.

```
---------------------------------------- CUT
------------------------------------------------------
# This is a sample quisk_conf.py configuration file for a SoftRock Rx/Tx Ensemble.

# Please do not change this sample file.
# Instead copy it to your own .quisk_conf.py and make changes there.
# See quisk_conf_defaults.py for more information.

# Attach your SoftRock Rx/Tx Ensemble to the line in and line out of a high quality
# sound card. Set name_of_sound_capt and name_of_mic_play to this card. You need
# a second (lower quality) sound card to play radio audio named name_of_sound_play.
# This is sufficient for CW. To transmit SSB, you need a capture sound card named
# microphone_name. The microphone_name and name_of_sound_play can be the same device.

from softrock import hardware_usb as quisk_hardware
from softrock import widgets_tx as quisk_widgets

# In Linux, ALSA soundcards have these names. The "hw" devices are the raw
# hardware devices, and should be used for soundcard capture.
#name_of_sound_capt = "hw:0"
name_of_sound_capt = "hw:2"
#name_of_sound_capt = "plughw"
#name_of_sound_capt = "plughw:1"
#name_of_sound_capt = "default"

# Vendor and product ID's for the SoftRock
usb_vendor_id = 0x16c0
usb_product_id = 0x05dc
softrock_model = "RxTxEnsemble"

# If you want to monitor the hardware key state, enter a poll time in milliseconds.
key_poll_msec = 0

sample_rate = 48000 # ADC hardware sample rate in Hertz
#name_of_sound_capt = "hw:0" # Name of soundcard capture hardware device.
```

```
name_of_sound_play = "hw:0" # Name of soundcard
playback hardware device.

# Microphone capture:
microphone_name = "hw:0" # Name of microphone
capture device
#name_of_mic_play = name_of_sound_capt # Name of play device if
CW or mic I/Q is sent to a sound card
name_of_mic_play = "hw:2"
mic_playback_rate = sample_rate # Playback rate must be a
multiple 1, 2, ... of mic_sample_rate
mic_out_volume = 1.0 # Transmit sound output
volume (after all processing) as a fraction 0.0 to 1.0
------------------------------------------------------ CUT
------------------------------------------------------

IP adress of your HIQSDR must be as default 192.168.2.196
IP adress of your Ethernet card must be 192.168.2.xxx
Connect HIQSDR to LAN and run Protocol Translator
Select sample rate.
Run SDR-Console V2.0, click on the blue triangle and "Defination" and click "Add".
Select "RFspace:NetSDR and SDR-IP"
Enter Name - any word
Model - SDR-IP
Serial - HIQSDR
Address - 127.0.0.1
Port - 50
Click "OK" and "OK", select your radio, sample rate, and click "Start"

Good luck !

Thanks for the hints; seems there was a problem with the firewall. It is working now at 50 kSps without interruptions in the audio. Nice stuff, thanks

HI Gents

I downloaded the software and at the first attempt i also had the bad sound when using 100 and 200 Khz.
Today when i connected it up again i am now able to receive in 200 Khz and sound is still ok :-)
Running XP>SDR-IP>HIQSDR>SDR Consol version 2.1 build 1494 (beta 32-bit)
When i connect it all work OK, but i can see that the preselector board is bypassed.
Would be nice if that one worked to :-)

1056. Improvement of MMIC tx_level

Yahoo group: n2adr-sdr
Date: 2013-09-22 11:18:16 UTC
From: <fink-hubert@...>
Topic: 1056 Message: 1056

Hello HiQSDR user,
some days ago Helmut DB1CC take a look to the Quisk tx_level parameter and the hardware controll of the MMIC.
The value of the parameter tx_level (0 .. 254) for modulating the MMIC in quisk.conf was very low with the correct drive power to the 10 watts MPPA amplifier.
By changing the component values of R35 from 2K0 to 3K9 ohms and L10 from 15µH to 2.2µH tx_level is now in the middle of the parameters at approx: 128
The operating point of the MMIC shifts to a finer adjustment of the output power.

On some HiQSDR the already excellent IMD 3 can improve.
We have take some pictures before and after the modification was done on my HiQSDR board.
On my own HiQSDR the IMD 3 improved only marginally.

More information with pictures can be found on the wiki HiQSDR:
http://hiqsdr.com/hiqsdr-wiki/index.php?title=HiQSDR-Modifications

I added VOX, voice operated relay. I improved the transmit audio speech processing. I added controls for the audio clip and preemphasis levels to the Tx Audio tab of the Config screen. Press the "Help" button to read the documentation on how to set your audio levels.

Hi Jim,

thank you very much for your continuing work on this great software.

Next weeks i will also start again to play with my Hiqsdr after it was in the cabinet for the whole summer ;)

regards
Mario

From: <jahlstr@...>
Topic: 1059 Message: 1059

I restored audio to the "Tx Audio" screen. I increased the digital (DGT-U etc.) transmit bandwidth to 5 kHz. The Ys and Yz settings that control the waterfall colors are now saved for each band. Just adjust Ys and Yz on a band, and these settings are restored when you return to the band.

I improved the receive AGC to reduce distortion. The AGC button now has separate slider values for On and Off. Right click the AGC button to set the sliders. Push the "Help" button to read the description of the AGC.

I corrected some bugs related to dark color schemes, and added color_bg_txt to control the slider text on the main screen.

1060. My first QSO with HiQSDR

Yahoo group: n2adr-sdr
Date: 2013-12-05 08:00:23 UTC
From: <dh5ym@...>
Topic: 1060 Message: 1060

This morning i made my first qso with the HiQSDR. Not a DX but a nice SSB with LZ2LP. I was running the MMPA with about 5W.
The rig is still open on the desk and i have to complete some stuff until it is ready.

I tried with my notebook that is connected via WLAN. Unfortunately i get some sample underflow via the network but the way of operation from the couch is rather nice ;)

I am not sure if my signal is really clean. In FDX mode my spectrum looks noisy somehow. I have to verify that and see what i set wrong.

regards
Mario

Congrats Mario,
I have had had lots of fun with the MPPA, including SSB DX contacts with good reports.
58 from KW7Y in Washington State.
59 from LU8EEM
55 from K6YRA in Los Angeles
56-7 from ZL2JVM (7 minutes)
Also a couple of VK contacts and quite a few with the Caribbean and South America.
73 ... Sid.

Hello Mario,
congratulations to your first QSO's with the HiQSDR.

It is enormous fun to use the HiQSDR over wifi outdoor on fine weather sitting in the garden. :-)

A Lot is going at HiQSDR:
- Herbert DG3MDE tests the HiQSDR on long wave and medium wave, build and calculate Filterboards

- Stefan DL2STG has something new to the firmware more Information from himself.

- Helmut DB1CC working on the 100W power amplifier, prototype is builded and at testing. A lot of work is to do with control and filterboard. Hope i got some pictures from Helmut to take it to the HiQSDR-Wiki.

- Myself have started yesterday with a friend to programming a ExtIO.dll to control the HiQSDR with Windows SDR Software. (I am not a software developer and normaly i use Linux so it can take some time...)

Mario here again thank you for your description of the frontend,
which is very helpful.

Also many thanks to Jim for the new Quisk.

By the way, everyone can share theirexperiences in HiQSDR Wiki if he wants to.

1064. Experiments with HiQSDR

Yahoo group: n2adr-sdr
Date: 2013-12-08 22:37:03 UTC
From: <gvjury@...>
Topic: 1064 Message: 1064

Hi All,

Hubert suggested that we could share our experiences with HiQSDR so here is what I have been doing and thinking about.

I have been working on building my own radio to give 25 W out in a single case with facilities to use it as an exciter for high power amplifier or barefoot at 25 W. My design is larely the same as the preamplifier but spread over 3 boards and the main changes are...
The interface to HiQSDR is via a level converter and I have put a copy of the circuit in .pdf format into the ZL2APV file folder.
The roofing filter has been designed to come down to 60 MHz as I had some interference from 70 MHz causing products on 10 M band. This filter is on a separate board together with the antenna changeover and exciter/external amp relays.
My band filters are mesh type and overlap for continuous filtering throughout 1.7 MHz to 30 MHz.
I do not have a filter for 50 MHz but rely on the roofing filter.
On Rx I have a 1.7 MHz Hi-pass filter in line while on 1.8 to 50 MHz and it switches out if I come below 1.79 MHz.
At present I am about to experiment with PIN diodes of the SMP1324-087LF series for antenna switching of the exciter which should remove a lot of timing problems particularly for driving the Linear Amplifier.
I have extensively used the VNA for filter testing and alignment and what a wonderful tool this is. I just love the job Steven did with his Qt VNA software and am waiting for Qt5.2 to arrive (3 days to go) and I want to get it to compile with that version and add the facility for Q measurement to it. At present I take 3 measurements and calculate it in a spreadsheet but integration would be useful.
Work is continuing on development of HiQSDR support for QtRadio and is being picked up by Michael DL2FW and I have agreed to assist him where needed.
I have used HiQSDR in a ZL CW contest and it was such an advantage with the spectrum display that I sort of felt guilty. I placed far better than my experience would suggest due to the Radio.
I would also like to hear from others how the radio is going for you, how you use it and what enhancements or modifications you have done.

73 Graeme ZL2APV

Interesting stuff Graeme.
I haven't check lately, the latest from Stefan's site I have is qvna-0.9.3.

I'll check as I have locally built Qt-5.2.0 and I use it to build QtRadio.
/usr/local/qt5/qtbase/bin/qmake -v
QMake version 3.0
Using Qt version 5.2.0 in /usr/local/qt5/qtbase/lib

Any developments, include me as I can test on openSUSE, ODROID-X and Pandaboard.
73 ... Sid.

Hi Rob,

I looked at Hermes and HiQSDR together when I was considering buying the basic radio and it was the VNA support that gave HiQSDR the edge for me. Even if Hermes gets VNA support I will still be satisfied with HiQSDR and happy with my choice. I know Sid sugested to the Hermes developers that they include VNA but I think they did not even respond to him.

I understand this time of the year's frenetic pace and I guess you will be head down for a while yet. Maybe when you surface I will at least have it compiling with Qt5.2 and I see Sid is already using the beta release and is using the latest version of Stefan's qvna.

When I suggested it Phil Harman took note and had a look at Stefan's code and came up with a Windows only version for Hermes within a few days. The FPGA code is in place, just no Linux software.

Right now in Linux only cuSDR does filter switching and I have been through the code a couple of times to see where and how it is done - no luck so far as multiple files are involved and nothing obviously suggests how they are knitted together. cuSDR64 works with my hardware as it does with the full ANAN-10/100 Apache-Labs transceivers.

Filter switching with the ANAN-10/100 works with hpsdr-server because it controls only the Hermes SPI bus on J15 whilst my eb104.ru BPF and PA/LPF boards use J16 open collector outputs. I haven't seen anyone using Hermes with openHPSDR Alex HPF/LPF boards which my hardware is emulating.
I know of one guy but he is not Linux savvy.
I wonder if the full ghpsdr3-alex version is available on Windows so I can ask him to try.

In PowerSDR a different tab, Filters is used for the ANAN-100 and ANAN Ctrl for my setup.
73 ... Sid.

From: <gvjury@...>
Topic: 1064 Message: 1070

I had a go at compiing Stefan DL2STG qvna with versions of Qt5.x and it turned out to be straight forward. I think I have made changes which will be universal so it will compile with either Qt4.x or Qt5.x with no changes necessary but as I don't have a Qt4.x version I can't be sure and would like someone to test this for me please.

The changes are as follows ...

Edit the qvna.pro file so the first few lines look like this

```
TEMPLATE = app
CONFIG += qt \
debug_and_release
greaterThan(QT_MAJOR_VERSION, 4): QT += core \
gui \
widgets
QT += network \
svg
```

Edit the includes in maim.cpp to look like this

```
#include <qglobal.h>
#if QT_VERSION >= 0x050000
#include <QApplication>
#else
//#include <QtGui/QApplication>
#endif
#include "qvna.h"
```

Edit qvna.h includes to look like this

```
#ifndef QVNA_H
#define QVNA_H

#include <qglobal.h>
#if (QT_VERSION < 0x50000)
#include <QtGui>
#else
#include <QMainWindow>
#include <QColorDialog>
#include <QMessageBox>
#include <QFileDialog>
#endif

#include <QUdpSocket>
#include "config.h"
#include "hiqsdr_ctl.h"
#include "diag.h"
```

Edit diag.cpp includes to look like this

```
#include "diag.h"
#include "ui_diag.h"
#if QT_VERSION >= 0x050000
#include <QScrollBar>
#include <QFileDialog>
#endif
```

As you can see there is not much typing so best of luck.

1071. CW via network ?

Yahoo group: n2adr-sdr
Date: 2013-12-14 20:23:34 UTC
From: <dh5ym@...>
Topic: 1071 Message: 1071

Hi,

i was wondering if there is already a way to do CW TX via network ?
What i want to do is use some kind of log with automated CQ calling / CW via keyboard and somehow get the HiQSDR transmitting.
At the moment i only see the possibility to connect a keyer circuit with PC connection to the HiQSDR key input and run cwdaemon on the PC. Somehow it would be nice to get rid of the external keyer and do all the CW stuff via the network interface.
Any ideas ?

regards
Mario

Hi,

i checked with clamav under linux with a current virus definition database and found no problems. I also have sometimes problems with wrong detections from the mcaffee scanner in the company.
Could anyone please check the file with another scanner than clamav or mcaffee ? I do not have a own windows system with that i could try. The file is located in the folder of rolin792 in the files section.

Mario

1074. RE: CW via network ?

Yahoo group: n2adr-sdr
Date: 2013-12-19 07:38:53 UTC
From: <dh5ym@...>
Topic: 1071 Message: 1074

Hi all,

I briefly discussed with Stefan. It should already be possible to generate CW signals via network via the PTT mechanism. I dont know if thats accurate enough but assuming that it is accurate enough there would only be the need for a cwdaemon like interface server that generates the keying from the cwdaemon protocoll messages. In that case any log program that has a cwdaemon client could be used to do CW operation together with Quisk.
@Jim: Do you think thats a valid idea ?

Topic: 1060 Message: 1075

Hi all,

Today i tried a bit with FLDIGI and Quisk and made some PSK31 QSO on 20m and 40m. It appears that the output signal is rather good. I had to use my old laptop because the loopback alsa device was not working on my desktop PC somehow. I will need to install a fresh Linux distro to the desktop ;) With the laptop i needed to connect to the cable network directly because WLAN was causing frequent dropouts during TX. Maybe i would have been able to fix this by setting the buffer size a bit larger but i did not try that.

A Merry Christmas to all members of this group here !

regards
Mario

1076. RE: My first QSO with HiQSDR

From: <gvjury@...>
Topic: 1060 Message: 1076

Hi Mario,

I also get underflows on wireless lan and have not looked at buffer sizes or using less bandwidth. A good workaround for me is to connect the sdr with a reverse ethernet cable and use the wireless lan for my general internet connection. The disadvantage of course is that HiQSDR is only available to one computer.

A Merry Christmas to all.

From: <dh5ym@...>
Topic: 1060 Message: 1077

Hi Graeme,

i tried with increased delay but without effect. Still get interrupts in the TX signal if working via the WLAN. If i connect to the switch were the HiQSDR is connected i do not have any problems. I assume the latency via WLAN is too big to maintain continuous signal. Most probably the latency parameter does not have any effect for TX but i am not sure.

From: <dh5ym@...>
Topic: 1080 Message: 1080

I tried a bit with HiQSDR, Quisk, TLF and cwdaemon in CW mode which works quite well. I placed a screenshot here: http://dh5ym.hopto.org/wiki/?p=1088
Maybe i should write a howto page ?
The setup is almost ready for a CW contest. You only need to operate TLF and Quisk is controlled from TLF via the hamlib. If the cwdaemon would run on a small machine close to the TRX it would be no problem to operate a CW contest from the couch ;)
My setup just lacks a bit of outputpower. Only 10W from the MMPA.

regards
Mario

1084. Setting low power on Quisk startup?

Yahoo group: n2adr-sdr
Date: 2014-01-19 20:52:14 UTC
From: <dr.diesel@...>
Topic: 1084 Message: 1084

I have a new AMP (Elecraft KXPA100) that requires an absolute max input power of 10watts. I'd like to find a way to limit the power on startup, so I don't accidentally forget to lower the power on my HiQSDR.

I see the tx_level parameter, but it seems to have no effect on setting the power level upon starting Quisk, any help or suggestions?

I have tried:

```
tx_level = {None:10} # Any number here has no effect
```

Or

```
tx_level = {None:10, '20':10} # Also no effect
```

Many thanks
Andy

From: <dr.diesel@...>
Topic: 1084 Message: 1085

Ok, I figured out that the tx_setting just rescales the Power sliders 0-100% reference! I have went through and set all bands to output 5 watts CW tone (as read from a Daiwa CN-801, which agrees with my Elecraft dummy load). I am surprised at the spread between bands, does this look normal to everyone else?

tx_level = {None:30,'160':31,'80':30,'60':30,'40':19,'30':17,'20':16,'17':12,'15':8,'12':14,'10':30,'6':120}

Even with 6-Meters at 120 I only get maybe 0.2 watts out?

Thanks for the help
Andy

1086. RE: Setting low power on Quisk startup?

From: <dh5ym@...>
Topic: 1084 Message: 1086

Hi Andy,

yes, the tx_settings scales the output power slider. Thats maybe a bit unexpected but the aim is to scale the slider gives always the same output power regardless the band.

Your scaling settings are not very familar to me. Is it true that you use the HiQSDR preselector with a MMPA ? Did you apply the IMD3 modification as described for the frontend on the hiqsdr website ? (I ask because that has effect to the scaling settings).

Within my setup the behavior of output power over bands is completely reverse (low power at lower bands and high power on the upper bands). But i assembled all the stuff on my own and did some stupid mistake most probably ;)
According to the description on the HiQSDR page i would assume that you get a lot of power out on the upper bands except 6m. I would further assume that you use the preselector filters also for TX and there is some fault in the 6m filter that causes additional loss (maybe you will not notice some few dB of lost sensitivity during RX operation).

regards
Mario

1087. Pass raw samples out of Quisk ?

Yahoo group: n2adr-sdr
Date: 2014-01-20 08:09:29 UTC
From: <dh5ym@...>
Topic: 1087 Message: 1087

Hi,

thats mainly a question to Jim ;)
Is there a easy possibility to pass raw samples in IQ out of Quisk to the loopback soundcard if you run a HiQSDR ? At least if the frontend runs in 48/96/192kHz mode it should not be too difficult, right ? Would there be the option for such an experiment ? The aim would be to run for example CWSkimmer or SO2SDR in parallel.
I know thats a conflict to the digital mode functionality but maybe thats not a real issue if its configurable in the config file.

What do you think ?

regards
Mario

Hello Mario,

I think the mode DGT-IQ will do what you want. Set the output device to the loopback device.

If you want to listen to the regular radio sound, and send a copy of the I/Q to a different device, then I can write that feature for the next release. Please let me know.

Jim
N2ADR

1092. RE: Pass raw samples out of Quisk ?

Topic: 1087 Message: 1092

Hi Jim,

i used the DGT-IQ mode to test CWskimmer with Quisk. Unfortunately in that case you cannot do normal operation anymore and the thing is limited to max. 20kHz. Sending the pure IQ data via the loopback device would be a cool thing. Then you can run serveral things in parallel or even a second instance of Quisk.

Hi Sid, Hi Dr. Diesel,

SMD Inductors with Q>30 are availalable but hard to find. We used a SMD type from Siemens,
but we ordered a complete Spool of 4000pcs.
In package pize 1206, Q>30 is more easily availabe and can be solderd to the Solder joint on hiQsdr as well with a little more work.

But Q >30 is not an absolute must! Here we have no filter use just to keep off RF from DC.
Higher Q is better but "normal" SMD Inductors should do!
Most 0805 Inductors 2.2uH (2200nH) are around Q>20, they are also usable!

Sid: the inductors you ordered are power inductors for switching regulators, not really ideal for that purpose!

73!
Helmut, DB1CC

>

1100. Update: QSDR V1.1.0

Yahoo group: n2adr-sdr
Date: 2014-01-27 13:28:59 UTC
From: dl2stg
Topic: 1100 Message: 1100

New version is available at http://dl2stg.de/stefan/hiqsdr/qsdr.html

Changes:

* Support for Ettus B200 via USRP
* Frequencies up to 10 GHz supported
* Gnuradio 2.7.2

73

I found these at RS Components.
RS Stock No. 785-5346
Brand Murata
<http://uk.rs-online.com/web/c/?searchTerm=Murata&searchType=Brand>
Mfr. Part No. LQW21HN2R2J00L

Specifications

Core Material Ferrite
Depth 1.2mm
Dimensions 2 x 1.2 x 0.9mm
Height 0.9mm
Inductance 2.2 ?H
Length 2mm
Maximum DC Current 75mA
Maximum DC Resistance 6.5?
Maximum Operating Temperature +85?C
Maximum Self Resonant Frequency 300MHz
Minimum Operating Temperature -40?C
Minimum Quality Factor 35
Package/Case 0805
Tolerance ?5%

73 ... Sid.

Hi Sid,

Yes no Problem, we have them on reels.

The part you snet before is also ok, sounds like our SIMID one.

Hello, Stefan. Good work! This way need to evolve. I don't can set a custom control of preselector.It must be done. I can't switch on LNA. And I do not understand, why noise floor stend up if I set attenuator -20dB.

Thank you.

1109. Re: [n2adr-sdr] Update: QSDR V1.1.0

Yahoo group: n2adr-sdr
Date: 2014-02-02 02:58:43 UTC
From: Sid Boyce
Topic: 1100 Message: 1109
Attachments: 1 described; binary payloads are missing from this source WARC

Hi Stefan,
I got qsdr-1.1.0 up and running on openSUSE but I have run into the old problem with it going silent clicking on some parts of the GUI and once in a while crashing.

Lots of lost packets
```
-------------------------
24: lost packets 1
209: lost packets 1
11: lost packets 1
169: lost packets 1
qsdr: pcm.c:2730: snd_pcm_area_copy: Assertion `src < dst || src >= dst
+ bytes' failed.
Aborted
```

There was a mod to change the audio buffer size but I can't find it in my email stash.

one build error fixed with "protoc --cpp_out=. trx.proto", protobuf in openSUSE is at 2.5.0
```
=====================================================
trx.pb.h:17:2: error: #error This file was generated by an older version
of protoc which is
#error This file was generated by an older version of protoc which is
```

BTW I am using gnuradio-3.7.3~git and hamlib-3.0~git both hand patched with gnuradio_audio.diff and hamlib-1.2.15-qsdr.patch.
73 ... Sid.

1110. digital adaptive predistortion

Yahoo group: n2adr-sdr
Date: 2014-02-03 13:44:24 UTC
From: dl2stg
Topic: 1110 Message: 1110
Attachments: 2 described; binary payloads are missing from this source WARC

Hi,

on the weekend I made some experiments with amplifier linearization using a method, called digital adaptive predistortion. For synchronizing RX and TX data, a small change of FPGA-Image is needed. Because of the already overcrowded Image, the signalprocessing is a software task. With the experimental gnuradio code, I'm be able to reduce IMD3 in my example from 43 dBc to 80 dBc. I think, it is a good result and a nice improvement for HiQSDR.

73
Stefan

Hi Stefan,

sounds pretty cool. Are you doing that in fullduplex mode ?

regards
Mario

Excellent Stefan,
It's also making all the noise on the opeHPSDR reflector.
73 ... Sid.

Hi Mike,
Unfortunately I can't fully test, but the TX button does work as PTT.

Sad story:- I did the ID3 mod and got no power out on TX.

When I checked L10 it was open circuit.
I replaced it with another of the same, still no TX but +3.8V is getting to the BGA616.
May be when the inductor failed it somehow took the BGA616 with it.

I am now trying to get a replacement BGA616. RS Components won't have any stock until 28th. so the alternatives, get 10 from China (they're very cheap) or take up an offer to get a couple shipped from Digikey to my contact Stateside and have them posted by him.

Direct from Digikey cost of 2 = ?2.60, shipment ?12.00 - the usual ripoff when anything is shipped via FEDEX or UPS.
73 ... Sid.

From: Sid Boyce
Topic: 1118 Message: 1118

Hi Helmut,
I got the 2.2uH chokes from RS Components, they are smaller and rated at 75mA which should be OK for 50mW output.

The first one I used may have been faulty and blew.
The second one is still intact but it looks like the BGA616 took a hit as there is no RF output.

73 ... Sid.

1120. Re: [n2adr-sdr] Update: QSDR V1.1.0 [1 Attachment]

Yahoo group: n2adr-sdr
Date: 2014-02-09 10:25:13 UTC
From: Sid Boyce
Topic: 1120 Message: 1120

qsdr-1.1.0 is running perfectly on ARM with none of the hangs or sound
interruptions I experience on x86_64.

I had to make the following changes for the ODROID-X running Ubuntu
13.10 ARM, substituting QtMultimediaKit for for QtMultimedia.

qsdr.pro

LIBS+=-lQtMultimediaKit

Makefile.Debug and Makefile.Release

LIBS=-lQtMultimediaKit

settings.cpp

#include <QtMultimediaKit/QAudioOutput>
#include <QtMultimediaKit/QAudioInput>

qsdrimpl.h

#include <QtMultimediaKit/QAudioOutput>
#include <QtMultimediaKit/QAudioInput>

root@odroid:/1/qsdr# qmake -v
QMake version 2.01a
Using Qt version 4.8.4 in /usr/lib/arm-linux-gnueabihf
73 ... Sid.

1121. Re: [n2adr-sdr] Update: QSDR V1.1.0

Yahoo group: n2adr-sdr
Date: 2014-02-09 21:08:45 UTC
From: dl2stg
Topic: 1120 Message: 1121

Hi Sid,

nice. Possibly there is a problem with the sounddriver or card on your
x86 system.

On 02/09/14 11:25, Sid Boyce wrote:

1122. digital adaptive predistortion code

Yahoo group: n2adr-sdr
Date: 2014-02-09 21:19:24 UTC
From: dl2stg
Topic: 1110 Message: 1122

Hi,

i have put the preliminary gnuradio code for the adaptive predistortion
on my page:

http://dl2stg.de/stefan/hiqsdr/gnuradio.html

You need a new firmware (fpga version sg8). The IMD3 improvement is now
up to 50 dB in some generic test cases after a minute training.

73
Stefan

1123. Re: [n2adr-sdr] Update: QSDR V1.1.0

Yahoo group: n2adr-sdr
Date: 2014-02-09 22:28:05 UTC
From: Sid Boyce
Topic: 1120 Message: 1123

```
Hi Stefan,
Possible though I have no problems with any other application -
ghpsdr3-alex, quisk (RX/TX), rasdr (RX/TX) all are solid on openSUSE.

I'll start building on Kubuntu 13.10 x86_64 later.
73 ... Sid.

From: Sid Boyce
Topic: 1113 Message: 1124

Hi Mike,
TX is fine on ODROID-X with the HiQSDR - quisk, rasdr and qsdr.
73 ... Sid.

From: Sid Boyce
Topic: 1110 Message: 1125

All up and running on the ODROID-X.
I had to rebuild qsdr to use gr-hiqsdr-0.3.0.

One question that springs to mind from reading the openHPSDR reflector -
They are using an RF Sampler with a 100W PA and I wonder how we can
accommodate adaptive predistortion at higher power with HiQSDR.
73 ... Sid.

Hi Sid,

i could imagine that its possible to use the 2nd input of the frontend for that purpose. Switching the RX path to the 2nd input and connect this to the forward path of a directional coupler after the PA together with some attenuation probably...

regards
Mario, DH5YM

1128. RE: Pass raw samples out of Quisk ?

Yahoo group: n2adr-sdr
Date: 2014-02-17 15:09:08 UTC
From: <jahlstr@...>
Topic: 1087 Message: 1128

Hi Mario,

The next distribution will have a config file option sample_playback_name that you can set to the name of a loop-back or Virtual Audio Cable sound device. Quisk then writes the samples to that device, and you can read them back with another program. This is addition to Quisk's normal processing. The new distribution will be out in the beginning of March.

Jim

Question to Stefan:
which version of Gnuradio are you actually using ? I tried the one supplied with Ubuntu 13.10 and i got errors that some parts are missing and then i tried compiling from the source but at about 74% it stopped due to some errors indicating that there is something wrong with portaudio.
Do you have some ideas ?

regards
Mario

1131. Quisk Version 3.6.16

Yahoo group: n2adr-sdr
Date: 2014-02-20 13:58:30 UTC
From: <jahlstr@...>
Topic: 1131 Message: 1131

Thanks to Arnaud, F6BZG, the latest Quisk version 3.6.16 now supports SoftRock CW keying using the USB port. I am rushing this version out so others can use this feature. But today I am leaving on a ski trip, so I won't be here to fix any problems. Please test the latest version, and if there are any problems, the previous version 3.6.14 is still on my web page.

Quisk Version 3.6.16 March 2014

I re-wrote the CW transmit logic for SoftRock transmitters. It now implements semi break-in CW operation. The config file options are key_poll_msec and key_hang_time.

I added the config file option sample_playback_name to play the raw samples to a loopback or VAC device. You can access the raw samples by reading them back with another program. See quisk_conf_defaults.py. The sample rate is the same as the hardware sample rate.

1132. RE: Quisk Version 3.6.16

Yahoo group: n2adr-sdr
Date: 2014-02-21 16:02:33 UTC
From: <dh5ym@...>
Topic: 1131 Message: 1132

Hi,
yesterday and today i tried a bit the sample_playback and it works great. I used it together with CWSkimmer. Hopefully i find some time to document the steps over the weekend. I could also imagine that it makes sense to use it to share a remote station as a websdr in parallel to normal operation with Quisk.
regards
Mario

1133. Altera firmware programming problems

Yahoo group: n2adr-sdr
Date: 2014-03-15 01:50:08 UTC
From: <gvjury@...>
Topic: 1133 Message: 1133

I am using
gvj@gj-dt:$ uname -a
Linux gj-dt 3.8.0-37-generic #53~precise1-Ubuntu SMP Wed Feb 19 21:37:54 UTC 2014 x86_64 x86_64 x86_64 GNU/Linux

I have just had a cheap programmer purchased from aliexpress arrive this morning so I modified the cable and gave it a try. When i list my programmer it shows as "USB-Blaster variant [1-10]" so I expect to be able to run using this name with quartus_pgm. I am using the quartus_pgm shell script inthe qprogrammer/bin directory.

```
gvj@gj-dt:~/Programs/altera/13.1/qprogrammer/bin$ ./quartus_pgm -l
Info: *******************************************************************

That suggests a hardware problem, probably cable.
I have seen that before.
What I can't quite remember was whether the Green LED was lit to show a proper connection. I suspect it wasn't.
In my case the micromatch plug was not properly seated.

Doing a search for the error brings up this result ...

Programming hardware cable not detected (ID: 213013)
CAUSE: Either you have not specified the programming cable and no programming hardware is added before or cable name is invalid. ACTION: Specify legal programming hardware, or use the Quartus II software Programmer to set up the hardware.I am not sure if by cable they mean the physical wires with connectors used to connect the programmer to HiQSDR or if it is a generic name for the programmer unit.

I have buzzed out all the wires and the connections are good and the plugs are carefully seated. I am wondering if the programmers have to be set up for some particular mode to do the job so will look at this possibility.

Thanks for your response Sid,

73 Graeme

When the USB is connected the Green LED is lit.
The adapter cable to X4 is 1->1 to the USB Blaster 10 pin cable.

Perhaps altera/13.1/qprogrammer/bin is the wrong directory, I use the
one below (quartus/bin).

/home/lancelot/altera/13.1/quartus/bin/quartus_pgm -c USB-Blaster
Transceiver.cdf

1138. Re: [n2adr-sdr] Altera firmware programming problems

Yahoo group: n2adr-sdr
Date: 2014-03-15 07:49:54 UTC
From: <gvjury@...>
Topic: 1133 Message: 1138

Yes the green light is on when usb cable plugged in. Ceccking version gives this
gvj@gj-dt:~/Programs/altera/13.1/qprogrammer/bin$ ./quartus_pgm -v
Quartus II 32-bit Programmer
Version 13.1.0 Build 162 10/23/2013 SJ Full Version
Copyright (C) 1991-2013 Altera Corporation
gvj@gj-dt:~/Programs/altera/13.1/qprogrammer/bin$

I don't have a /altera/13.1/quartus/bin/ directory and my structure still lets me run quartus_pgm ok but I can't find any command line help for it anywhere apart from -h which is minimal. As the programmer has never been used before I am not sure if it is /quartus_pgm
1. configuration of the programmer
2. Altera software install not good
3. Programmer is faulty
4. HiQSDR is faulty.

I tend to think HiQSDR is OK and the radio stops when programmer is plugged in as I would expect and starts when unplugged. I am sure of my cable and it definitely checks out pin for pin and I have got a picture of the Altera pinout to double check that the pin with the coloured wire is actually pin 1.

I may need to install the full graphical programme so I can get the setup options as I can't see any for the command line or any documentation for it.

Thanks for your persistance,
73 Graeme

1139. Re: [n2adr-sdr] Altera firmware programming problems

Very interesting, I have never had to specify Active State and I have upgraded from Version 1 through to Version 8 every time a new version became available, using whatever has been the latest Web Edition at the time.
Quartus-web-13.1.0.162-linux.tar

qprogrammer was in 11.0 and 12.1 only, changed to quartus from 13.0, that's unless they have changed 13.1.0.162 since I downloaded it.

1141. How to port Quisk to Mac OS X Maverick

Yahoo group: n2adr-sdr
Date: 2014-03-17 18:18:26 UTC
From: <louijp@...>
Topic: 1141 Message: 1141

Hello Quisk experts,

I am trying to build the last version (3.6.16) of quisk on my macbook, and I am not sure how to switch
from ALSA to Portaudio, so my build always fail with a
"Missing Alsa/asoundlib.h"
What do I need to do to build with portaudio instead?
Thanks in advance,
73 de Jean-Paul (AC9GH)

1142. Problem with Quisk and digital modes on A20-Olinuxino

Yahoo group: n2adr-sdr
Date: 2014-03-20 21:53:11 UTC
From: <frspin@...>
Topic: 1142 Message: 1142

I am testing a A20-Olinuxino, ARM A20 dual core at 1 GHz and with 1 Gb of RAM, running Debian Wheezy
Quisk compile and install without any problem and run with my H101 old SDR.
Resource usage is satisfactory. About 50% ao RAM and 60% of CPU.
Alsa loop is loaded and digital output is defined in quisk config file.
When I switch to DGT-U or DGT-L mode, sound become chopped also without starting Fldigi.
RAM usage is about 60%, no swap but CPU go to 80-90%
Is this a problem due to poor performance of ARM SOC or can I do some optimization? Is snd-aloop a "resource hog"?

Regards
Franco Spinelli

From: <hgoebkes@...>
Topic: 1143 Message: 1145

Hi Group,

up to now there are around 280 HiQSDRs used worldwide.
Most of them (98%) was sold "ready built" and just 2% was sold as PCB

HiQSDRs are spread over the whole world,
in nearly each country in Europe but also we have some HiQSDRs in
Russia, Kasachstan, Baltic States, Greecs, India, China, Australia, U.S.A.
and some in Japan, but just 1 pcs on the whole Afrikan continent....

Not so bad for a pure ham spirit driven development, i think.

I can give only numbers for HiQSDR i made, maybe some more are used because
this is a open source project and we had some requests from China and India
for gerber files to make they own..... (probably not always for DIYs purposes....)

Most are used as it was developed, for amateur radio use but some HiQSDR Modules
are used as measuring / testing devices in Companys
(Aeronatic, Research, Broadcast, Universities...)

Hope this info helps

Helmut, DB1CC

From: HGoebkes
Topic: 1147 Message: 1149

Hi Yuri.

The Preamp is on the Preselector and activated by Software via the +10dB button.
The associated Pin should toggle if you klick the button on Quisk.
Be Aware that the signals coming directly from the FPGA, that means that you have
CMOS 3.3V Signals (aka "HCT" compatible) not 5Volt signals. Be careful not to inject signals into outputs
because the FPGA is a Little sensitive to this!
Please chak also if you have tha actual Firmware on the FPGA!

73!
Helmut, DB1CC

1150. Re: Turning on preamp from Quisk

Yahoo group: n2adr-sdr

From: <gvjury@...>
Topic: 1147 Message: 1150

Hi Helmut,

Thanks for the reply. My "preamp_on" output is fed to an 74LVC4245 level converter where the 3.3 to 5V translation takes place. I have done a further test using ghpsdr3-alex and the preamp switches just fine with that software but does not switch when I use Quisk and selecting the +10 db setting in its attenuator button. Maybe I need to set something in the config file or there is some other problem so in summary ...
1. The preamp switches with ghpsdr3-alex
2. The preamp does not switch with Quisk.

My preamp is a Norton feedback amplifier and not the standard one as used in your preamp board.

1152. HiQSDR WIN8 audio issues

Yahoo group: n2adr-sdr
Date: 2014-04-13 14:03:49 UTC
From: <peter@...>
Topic: 1152 Message: 1152

I realize i am probably a singularity in this forum even to mention the word Windows, but I give it a try anyway!

Over the past weeks I've assembled the HiQSDR board as produced by DB1CC. I managed to program the FPGA and got it working after I installed Python 2.7.5 and Quisk on my Windows machine. But..., the audio works fine for just a few minutes, then gets distorted. I run a fairly recent dual core machine, hence processing power should not be an issue. I made changes to the audio device as required in the config.py file, but that did not improve on the issue, nor changing the audio latency. Odd enough, changing the audio level settings in Quisk gave a change in the audio perception. It altered the audio, not just changed its strength.
Subsequently I've installed the SW on a Windows (sri guys) Netbook. The audio performance remains stable on that machine, but processing power is probabaly the reason why it crashes after 10..20 minutes.
Is there anyone who has experience with the installation of Quisk on a WIN8 (8.1 to be exact) machine and may offer a solution for the audio issue?

From: <dh5ym@...>
Topic: 1152 Message: 1154

Hi Peter,

unfortunately i do not own a Win 8 machine. Just can tell you that it was working fine some versions ago on a Win 7 system. The problems you describe might be caused by the soundcard driver itself or maybe some buffer running empty somewhere. Do you have a chance to try a USB soundcard on the same PC were you get distorted audio ? Probably thats a workaround for the moment, although not a very nice one.
Another question: do you connect the HiQSDR directly or via some network ? I use it via WLAN usually and sometimes the network drops some frames. This causes distorted audio for some seconds since its a jump to the filters of the processing. This one you would see in the config screen because the frame error counter increases. In that case you have a problem with the network card.

regards
Mario

1155. Re: HiQSDR WIN8 audio issues

Yahoo group: n2adr-sdr

From: <peter@...>
Topic: 1152 Message: 1155

Hi Mario and Jean-Paul,

Thanks for the replies! I think SDR is a kind of Linux thing, but it ought to work well on WIN systems (or any other OS for that matter). The audio issue is not yet resolved. This evening I installed the SW on a third machine (Vista!) which can handle the processing easier than the notebook. The sound seems to stay OK, but after 10 minutes the system hang itself. I tried twice this evening, then called it a day. I think that apart of the (WIN8?) audio problem, there might be a lose contact of one of the pins of either the FPGA or any other device (I did check many times under a magnifying glass, but still...). I don't think this is related to the WIN8 audio problem, but I want to resolder the pins to rule it out. For Mario, I did not use a separate USB sound card yet, but I can borrow one to rule the WIN8 issues out (or to confirm it!). First resoldering 240+ pins!!!

73s,

Peter

1156. Re: HiQSDR WIN8 audio issues

From: <gvjury@...>
Topic: 1152 Message: 1156

Hi Peter,

I don't think your problem is a hardware one or windows related beyond the possibility that audio processing may be more demanding of the machine.

Two things to try
1. Connect HiQSDR to your ethernet port with a crossover cable to get rid of your network latency.
2. increase the latency to a big amount like 1200 in your quisk.conf.py file

```
# latency_millisecs determines how many samples are in the soundcard play buffer.
# A larger number makes it less likely that you will run out of samples to play,
# but increases latency. It is OK to suffer a certain number of play buffer
# underruns in order to get lower latency. default = 150
latency_millisecs = 1200
```

I am sure it is a buffer overflow/underflow problem and you may need to experiment to get it right. Once it is going you can reduce your buffers until the problem shows then go up one step.

I have had this happen with latency = 64 in my linux system.

1157. Introducing the Hermes-Lite

Yahoo group: n2adr-sdr
Date: 2014-04-13 22:12:50 UTC
From: <steve@...>
Topic: 1157 Message: 1157

Hello List,

I have been working on a lower cost DDC/DUC transceiver which I am calling Hermes-Lite. All the details are at

https://github.com/softerhardware/Hermes-Lite

Although this runs ported Hermes FPGA code, I would eventually like to port the HiQSDR RTL to this new radio.

The design is entirely open source and open hardware. The cost of all materials (including the BeMicro SDK board) is around $150. The FPGA firmware is a port of the Hermes RTL and is compatible enough to work with existing Hermes software. The ADC/DAC is the AD9866 12-bit integrated device intended for cable modems which I have repurposed as a 0-36 MHz transceiver. RX/TX tests of my prototype show good performance. The github site has instructions for listening to the receiver online.

I had hoped to have a more polished project before releasing, but I am starting a new job tomorrow and will have limited time for this project. Any help on this project or derivatives is welcome.

From: Sid Boyce
Topic: 1157 Message: 1159

Hi Steve,
I have only just finished reading details of Hermes-Lite on the hpsdr reflector and github.
Very interesting project indeed. Thanks for the picture and the comparison data.

I have Hermes + eb104.ru BPF + 300W PA/LPF, just waiting for the new cuSDR or John Melton's glSDR for Hermes so I can TX. The HiQSDR + Preselector/10W PA has been a good DX performer for me.

One project I haven't got back to is the Hermes emulator for the RTL-SDR dongle, everything looked OK but my homebrewed HF upconvertor doesn't work. I'll have to look at it closer, seems to be an oscillator problem ~300mV out. Apart from that problem, the server ran and cuSDR64 connected to it.

Hermes-Lite emulating HiQSDR as a goal, just great.
73 ... Sid.

Hi Peter,

the crash issue is maybe not related to your audio issue.
Yesterday evening i had two crashes after a couple of minutes running Quisk in the background and using the internet browser in front. I use it under Linux. It seems to be a problem in the C-code since it just tells that there is a fault in memory access when it stops.

From: Rob Frohne
Topic: 1161 Message: 1161

Hi All,

If you have been trying to connect to the KF7O Hermes Lite receiver to try it out, there has been a problem that I can't ping the napan.ca server from it because of a blacklist problem or something similar. That makes it not show up in the server list from glsdr or QtRadio. You can still connect to it by selecting the IP manually which is 74.85.89.174. I'll be working to find out what the issue is in the mean time.

Topic: 1152 Message: 1168

Hi Mario,

No, I did not run the test with the external sound card yet, basically because it works fine on a Vista and WIN7 system. Hence, it seems a specific WIN8 issue. Meanwhile I've ordered the ODROID U3, so I'll make the swap to Linux next week (which will be a major change for this WINDOWS boy, hi!). The U3 should be more than capable enough to support HiQSDR, just learning how to deal with Linix, that'll be achallenge, hi!
Best 73s,
Peter

1169. Re: [n2adr-sdr] Re: HiQSDR WIN8 audio issues

Yahoo group: n2adr-sdr
Date: 2014-04-19 20:39:07 UTC
From: Sid Boyce
Topic: 1152 Message: 1169

Hi Peter,
The U3 is more than capable, faster CPU speed and twice the memory of my ODROID-X which runs the HiQSDR using qsdr, quisk and ghpsdr3-alex from http://napan.ca/ghpsdr3/index.php/Main_Page.
I have some weak component on the ODROID-X that causes it to freeze if run it at 1GHz so I run it at 900MHz.

Quisk is the obvious place to start as it is very quick and simple to get up and running once the pre-req packages are installed. This list of packages also includes those needed for ghpsdr3-alex.
"sudo apt-get install libfftw3-dev libasound2-dev libportaudio2 portaudio19-dev libncurses5-dev libwxbase2.8-0 libwxgtk2.8-0 python-wxgtk2.8 python-wxversion libusb-dev python2.7-dev"

The ODROID-X with Ubuntu 13.10 runs qsdr solidly whereas it suffers loss of sound an occasional crashes on x86_64.

Hi Sid,

I do intend to run Quisk, at least as a stating point. I should have the ODROID by Tuesday, hope to have first results later this week. Indeed, the U3 seems a potent system, although I have not a clue how the processing load is divided over the 4 cores. I suppose it would need tweaking/re-writing of the Quisk SW in order to get best performance?
Quite a string of characters you've posted, hi, I'll try to run it!

best 73s,

Peter

Hi Peter.
Don't let the string of characters scare you.
Cut and paste the command into a terminal, hit Enter and it installs all
you need.

I have not done any checks on CPU usage to see how many quisk uses but
it runs smoothly without any problems using the Mali400 GPU driver, the
GPU does the number crunching more powerfully than the CPU's can.

The U3 also uses the Mali400 GPU. If the driver for it is not installed
by default, there is
mali-xorg-1.14_video.20131123.tar.gz from
http://odroid.txmonitor.de/software/linux/mali400/ which has them.

I'll help you with the few steps needed to install them.
73 ... Sid.

1175. Quisk Version 3.6.17

Yahoo group: n2adr-sdr
Date: 2014-05-31 16:23:51 UTC
From: jahlstr@...
Topic: 1175 Message: 1175

Philip G. Lee contributed code to provide native PulseAudio support for Quisk. You will need to install the package "libpulse-dev" to compile. Thanks Philip!

Stephen, K6BSD, provided patches to support FreeBSD. Thanks Stephen!

The Spot button now works in CW mode with softrock USB hardware. There is a new slider control for SoftRock transmit level on the Config/Config screen.

The new config file options file_name_audio and file_name_samples are the initial names for saving audio and samples on the Config/Config screen. I added more sample rates to support different hardware.

Hi Peter,

Are you connecting to your lan via wifi on either HiQSDR or your computer? I get this problem as my lan speed is too slow with wifi and I need to be ether cable connected. I can run quisk and HiQSDR with my netbook (just) with XUbuntu wifi connected but after 10 or so minutes it pulses and breaks then settles down only to pulse and break again so that should give you an idea of hardware constraints.

Thanks Jim,

Have installed it with Rx running fine but microphone breaking up. If I record the audio in the config/Tx panel it sounds fine so I will chase it up further. At this stage it is not a bug report, just a heads up and a chance to say thanks to all involved with the new version.

Hi Graeme,

Thanks for the reply. I am running the ODROID as a stand alone system and the HiQSDR is the only attached device using ethernet (and I occasionally connect to internet). What i get is a chopped audio as long as the Microphone is selected as an input in the config file. When I uncomment the microphone line (device select) the audio is okay and not chopped. I have not tried the brand new release of Quisk, which might just solve my sound issues. Will let you know tomorrow, as the device is at QRL.

Best 73s,

Peter, PA3BIY

I installed Quisk v.3.6.17, but there does not seem to be any improvement regarding proper audio support for the ODROID U3 internal sound card. Whether this is due to Quisk or lack of ODROID driver support I can't determine for sure, although the latter seems likely. I had high hopes whem I read that Pulse ws incorporated/improved, but when I tried to run Quisk 3.6.17 the RX audio worked for 4 seconds and then disappeared. Why did I buy an ODROID platform??

73s,

Peter

I'm not having much luck with pulse. The latency is is very high on Rx in the order of 1 second or more although it works perfectly well in otherwise.. On Tx there is the same latency plus the audio is only in bursts of a part second or so and very staccato. I have had to revert back to hw:0,0 for mic and play where it works normally.

Definitely not quisk, hardkernel have never properly supported the
max98090 sound chip.

At first only a few mixer controls would show up and Mike (KL7NOA) and I
had been bombarding them with queries to get it working or working
properly.
Now a raft of controls show up in alsamixer but no way can I play a file
to card 0. "aplay xxx.wav" comes out of the USB sound card (card 1) and
I haven't found out how - asoundrc and pulseaudio configs all look sane.

It's never been 100% functional and when it's worked sound has been
bloody horrible.

I did ask them about having their kernel supported upstream along with
50-odd other ARM boards and they said it would NEVER happen.

My advice is to get small form factor USB cards.

I'll reawaken the topic on the odroid forum this very day.

1185. Quisk Version 3.6.18

Yahoo group: n2adr-sdr
Date: 2014-06-23 16:24:45 UTC
From: jahlstr@...
Topic: 1185 Message: 1185

The Windows installer now works with the new WxPython 3.0. Previously it required 2.x. I fixed an annoying sound loop that happened on Windows when quitting Quisk.

The Rx Filter screen now displays the bandwidth of the filter at the 3 and 6 dB points. I improved the calculation of FFT size for fft_size_multiplier==0. I added more FFT buffers to improve performance at high data rates.

When you right-click the S-meter, there are new options to change the S-meter time constant, and to measure the audio voltage.

Jim

Topic: 1185 Message: 1186

Again thanks Jim. All installed and running just fine. The hold time for the s-meter is a great help in generating more accurate reports and audio levels are very helpful for testing. The problem with pulse sound is still there with high latency and distortion on Tx but Alsa is still great. Did not notice any change on wideband but I usually am on CW with 48 KHz rather than spectrum scanning.

Topic: 1185 Message: 1188

I had a problem on Linux .... and it might be something with Fedora20
since im having issues with other sdr software ...

Im useing the softrock fixed config ... and iv set the setting for fixed
display center freq to be 7.2685mhz but when running quisk , maybe 40
times out of 41 the display freq scale is shown as the audio freq....not
the Rf freq and if i click on the pan display audio is lost (just noise
- like band noise) and if i enter a freq into teh manual window and hit
enter , the Rx shows in the spectrum window (if i enter a freq with in
the soundcard bandwidth) and i can re-enter freqes till i land on a
signal i want to hear and Rx is correct ....

Once in a while, the frequency scale is correct and i can click on a
vocal transmission and the Rx is fine ....

I probably explained that terribly ..... ill D/L the new and install

Don't get too involved in thinking why .... if i cant solve my Qt5.3.1 /
qmake / codec2-dev linking (for ghpsdr3-alex) issues by next weekend im
going to wipe the drive and go back to Ubuntu.

Im running Ubuntu 14.04 .... i dont have those issues ...

I do have a question, is there a way to change audio phase inputs? ...
some cards have an offset due to the way data is transferred ...

I/Q correction used to work .. but now it dosent and im not sure why at
the moment ....

Does

channel_i = 0 # Soundcard index of in-phase
channel: 0, 1, 2, ...
channel_q = 1 # Soundcard index of quadrature
channel: 0, 1, 2, ...

mean that its stereo(yes) ...? what does the effect of choosing 2 or 3 have?

1194. souncard offset ...

Yahoo group: n2adr-sdr
Date: 2014-06-25 22:26:34 UTC
From: Mike
Topic: 1194 Message: 1194

Man .. it really never fails ....

ask a question on a forum .... and less than an hour i usually find the answer ... even if i had looked fop a few days ...

```
# Thanks to Franco Spinelli for this fix:
# The H101 hardware using the PCM2904 chip has a one-sample delay between
# channels, which must be fixed in software. If you have this problem,
# change channel_delay to either channel_i or channel_q. Use -1 for no
delay.
channel_delay = -1
# This is for mic playback (SoftRock transmit):
tx_channel_delay = -1
```

So then i guess i put the line

```
channel_delay = channel_i
```

in the .quisk_conf.py of the home folder (after the sound card naming) ... Right?

Hi Peter,

My installation is on a standard desktop dual core machine with nvidia graphics.
I used wxgtk2.8 and don't have 3 installed.
There are no real differences between Ubuntu and Mint except for the user interface. The Unity desktop in Ubuntu is really good but I guess I had got used to things like displaying open apps on the status line and preferred the old fashioned style of desktop. I use XUbuntu on my netbook and Quisk runs there, but only just, with the cpu at about 90% most of the time. ghpsdr3-alex runs at about 60 to 70% and I can web browse at the same time. I really like the clean interface that Quisk provides with everything accessable from front panel buttons and just wish it was a bit easier on the processor so I can sit in the lounge in front of the fire on a winter's night with my netbook and go on air without the frequent dropouts but it is great on the desktop in my shack.

A guy with a lot of experience with ODROID is Sid G3VBV and he lurks this forum so perhaps he can come up with something useful.

On the ODROID-U3 I run lubuntu 14.04, no sound from HDMI or the Headphone socket with quisk. I have to use the USB sound card but it works reliably for RX and TX. Had a short QSO (55 report) with K6YRA this afternoon with the HiQSDR and 10W PA.

With qsdr and rasdr HDMI sound has worked sometimes. It will at times switch from HDMI to USB sound automatically. Currently they all are using USB sound.
mdrjr, the harkdernel developer suggested I upgrade the U3 to the 3.8.13.23 kernel which I'll check out shortly. He also said he would post an updated 14.04 image but I haven't seen it appear on http://odroid.in/ubuntu_14.04lts/

With on-board/HDMI sound I get solid errors with quisk.

Display is normal and up to samplerate 960K is OK on all platforms.
73 ... Sid.

There is no python wxgtk 3 package for either Ubuntu x84_64 or ARM.
There are gtk3 and python3 packages but no wxPython3 on any distro - 2.8
is still the only version available.

the latest on openSUSE only is python-wxWidgets-2_9 and
python-wxWidgets-2_9-devel but I use 2.8.

Tnx to Graeme and Sid for replying. I checked the Python installs, and they are identical to the ones you showed, Sid. For 1 minor (?) detail: the figure around UBUNTU are 2UBUNTU2, not 14UBUNTU1.1. Otherwise the version nrs are identical.
Sid, do you have the UBUNTU version released by ODROID 2 weeks ago installed, or a different version? As i see it now the installs from you and me should be identical (except perhaps for a different sub version of the OS??).

Glas to hear that there is something moving regarding the build in sound card. I also use an external USB stick now, which works like a charm, but it would free up a USB port if the internal sound card becomes available for QUISK.

73s,

Peter

Oops! just realised I am still on 13.10 on the ODROID-U3 and was waiting
on the new 14.04 Desktop release.

It offers to upgrade to 14.04 but I thought I would wait for the
promised release and burn that to a new microSD card.

I built and installed kernel 3.8.13.23 on the U3, no change in the audio situation.

It's the same as on the ODROID-X running 3.8.13.18 and the U3 running 3.8.13.16.

Hi Sid,

Sad to hear about the lack of improvement using the new Kernel. Hence we'll be stuck with our external sound cards.
I'm curious if QUISK will work flawlessly on Ubuntu 14.04, once you've up-graded.

73s,

Peter

I shall now be installing lubuntu 14.04 on the ODROID-X while I wait for
the 14.04 U3 as I don't want to upset the working setup.

I don't have a screen connected to the -X, I would need another
microHDMI cable.

I have ordered the 7" screen from pollin.de.

Due to lack desk/shelf space for them I don't have UHFSDR or Ensemble RXTX connected to check on image suppression.

I have never been happy with sound card and SDR-Widget I-Q performance.

Hopefully with KL7NA's Hermes-Lite being developed there will be a very cost effective DDC/DUC SDR. The last time I hooked up to Rob's with QtRadio it was looking great.
I got the BeMicro SDK yesterday and I have ordered a board from Rob. The board may have to go through other revisions - we'll see.

Both Tim (W4YN) and I use the 300W PA/LPF and BPF boards with
Apache-Labs Hermes.

I have not given any thoughts to using it with HiQSDR so far.

Tim, I can't find the SPI switching circuit one of the guys gave us, may
be that may be what's needed.

I had a quick look at the latest fpga_ver3-sg9.tgz firmware which
implements GPIO-Module support via SPI which I need to further study.

May be dl2stg can shed some light on how it's currently being used.

At the moment KL7NA has "Hermes" up and I am connected with QtRadio on
the ODROID-U3.

When I last connected to "Hermes-Lite" (different - the clone) which is
off air now, it was solid.

I started with Fedora 19 and upgraded to Fedora 20 when it went GA,
QtRadio works for me.

Hi Jeff,
The last upgrade I did was the 2.9 rbf file using HPSDRProgrammer V2
over the network.

I have never used the bootloader code, I have always used HPSDRProgrammer.

A strange thing happened when I was upgrading, HPSDRProgrammer told me I
had Hermes and I think Metis online, so it was detecting the presence of
both Hermes (192.168.10.77) and the HiQSDR (192.168.2.196).
I was at first puzzled and used a PC that was not connected to the
192.168.2 network before I realised what was happening.

I just got the apache labs hermes board and want to use it for receive.
I don't know if you use power sdr but with checking hermes and no Alex or Apollo ,
I get crashes when I change bands. Almost like it wants to control some other hardware.

Do I have to set it up special to work only by itself?

Jeff

Both Tim (W4YN) and I use the 300W PA/LPF and BPF boards with
Apache-Labs Hermes.

I have not given any thoughts to using it with HiQSDR so far.

Tim, I can't find the SPI switching circuit one of the guys gave us, may
be that may be what's needed.

I had a quick look at the latest fpga_ver3-sg9.tgz firmware which
implements GPIO-Module support via SPI which I need to further study.

May be dl2stg can shed some light on how it's currently being used.

1217. RaSDR

Yahoo group: n2adr-sdr
Date: 2014-06-29 22:15:59 UTC
From: gvjury@...
Topic: 1217 Message: 1217

Hi all and p0articularly Strfan,

I downloaded and upgraded the firmware on my HiQSDR to FPGA-1.3-SG9 from Stefan DL2STG and quisk reports (from config button) "firmware version 1.87"

I downloaded and compiled RaSDR version 1.3 and was amazed at how little demand was placed on the computer with fpga doing fft processing (about 16% on my netbook) and it runs well except for the area under the cursor which has a very small signal +/- centre frequency which interferes with low level signals. This is not there with Quisk so I was fairly sure that it was a spurri from RaSDR.

To be certain I downloaded and compiled QSDR Version 1.1.0 which had a few compile issues for me. Checking the signals there was no trace of the 2 spurious blips on QSDR centre frequency either.

I am using Linux Mint 17 and the install of QSDR had some problems which may be there for others so briefly the issues are ...

Linux mint uses QMultimediaKit rather than QMultimedia so references need to be altered.
e.g. in qsdrimpl.h references to QtMultimedia were changed to ...
#include <QtMultimediaKit/QAudioInput>
#include <QtMultimediaKit/QAudioOutput>
As the compiler flags others you can change them accordingly I am not sure if there were any more.

The protocol buffers had been compiled with an earlier version than the one with Linux Mint and need to be recompiled so from same directory as trx.cpp ...
protoc --cpp_out=. trx.proto

The Makefile.Release contained -lQtMultimedia as well as -lQtMultimediaKit which stopped the make. I simply deleted the term -lQtMultimedia from it and all compiled and ran fine with the other steps as described by Stefan on his web site. I have not chased up the reason for -lQtMultimedia still being in the makefile yet and may not do so as I will probebly spend my time getting it to compile with Qt5.n.n - if I can:-)

Stefan if you are reading this I would be grateful you could comment on the spurious signals on the centre of RaSDR and if they are there for you or not. I can post screenshots etc. if you need this. Comments form others running RaSDR would be welcome too.

Hovering around 26.5 - 27.5% CPU and 2% memory on the ODROID-U3 with Ubuntu ARM 13.10.

The only thing I can remember was the QtMultimediaKit changes, other than that the build went smoothly.
There is only one oddity, USB TX RF output behaves like CW key down immediately with no speech variation.

With qsdr the settings and menu sections are not visible until clicked - there is just a white background on the settings with just the arrow heads visible, should have been OK as it is on the ODROID-X.

quisk is fully functional - I didn't check on the resources it uses.
73 ... Sid.

Hi Sid,

Thanks for the response. You may get a better display from QSDR by using qtconfig-qt4 and choosing clearlooks or windows for the theme. I also find I need to click on the samples to fire up the radio sometimes.

I wonder if you have tried RaSDR Version 1.3 and if you get the 2 little signals each side of centre? It is like hum on the zero frequency on soundcard sdr's. I am wondering if it is hum and just on my radio or if it is a bug in RaSDR? I don't get the blips on any other radio and the only effect I notice with Quisk is that if I receive an AM station dead on the centre frequency, the carrier is gone in the centre notch and similar for a CW signal. It is so rare to coincide the signal with the centre that I have only noticed it once or twice.

73, Graeme

rasdr_1.3.0 has been running since your original post. I have been
running it from time to time over the last month.
ls -l /usr/local/bin/rasdr
-rwxr-xr-x 1 root root 259252 May 30 12:48 /usr/local/bin/rasdr

There are 2 feint traces 5KHz either side.

I am in a digital noisy environment with more stuff in the room than you
can shake a stick at so I do expect a bit of noise but they don't cause
trouble.

When I tune to them I can hardly hear anything.
73 ... Sid.

Thanks Sid,

Here is my screenshot. I moved the frequency so the waterfall under the cursor was exposed for the sake of the screenshot. As you can see there is a very small signal of a few hertz showing up each side of centre.

Strange you have exactly the same mush at 14.211 as I have.

I had thought that it was locally generated but it must be internally generated. It's peaking S7.

I don't have the spike at 14.02389. Someone has just started transmitting CQ on that frequency RST 539.
73 ... Sid.

Hi,

the blips on center are rounding errors in decimation data, only used for the fft and waterfall representation (internal representation is 18 bit, the output for waterfall is only 16 bit width).

Thanks Stefan,
I have one strange happening I can't explain - turning on TX in USB immediately outputs a signal with full power deflection, exactly like key down in CW mode.

1226. qsdr-1.1.0 build

Yahoo group: n2adr-sdr
Date: 2014-07-01 11:39:53 UTC
From: Sid Boyce
Topic: 1217 Message: 1226

Changed the subject from rasdr
==========
In trying to rebuild qsdr on ARM I had to make changes you outlined
below for QtMultimediaKit.

I also got some protobuf errors during make, fixed with the following
as the source trx.proto was built with an older version of protobuf:-
"sudo apt-get install protobuf-compiler"

In the qsdr directory:-
"protoc --proto_path=./ --cpp_out=./ --java_out=./ --python_out=./
./trx.proto"

I'll have to try rebuilding on x86_64, fairly sure I'll hit the same
problem.
73 ... Sid.

As an after thought I would advise authors to keep current with their distros as sometimes radical changes obsolete parts of their source code. Added to what the distros supply like ortp, there are many of the ancillaries such as codec2, gnuradio, etc. making changes.

There is a tendency for some developers to develop their apps without regard to what the underlying OS is doing that obsoletes their code when attempts to build it on updated distro versions. Developing on Ubuntu 12.04 may not play well with installs of 14.04.

My boxes started at Ubuntu 11.04 and have been progressively upgraded to 14.04, likewise with openSUSE from 11.0.Milestone1 to 13.2 Milestone 0, Fedora 19 to 20.
As Linus said, the only constant in Linux is change.

In the last 2 decades of upgrading I have seen far more problems generated by not upgrading than by upgrading. There have been innumerable instances when the only recommendation has been to upgrade, more often than not the kernel.

Many times weekly I check and do upgrades. Yesterday 476 updates done to openSUSE which is the most active with sometimes hundreds daily and today so far 37.
Fedora 20 after the last update 2 days ago now has done 73 more. Ubuntu is extremely quiet by comparison but all are extremely stable.

On ARM I have had to convert cuSDR32 source files from qreal to double with " find . -type f -print0 | xargs -0 sed -i 's/qreal/double/g'" - that's 's/qreal/double/g' but there is still one error I have not yet found a fix for.

One big gotcha for people changing distros is package names which are always very different, e.g yesterday on the beagleboard list there was one guy wanting to install qt-embedded (Angstrom) on Ubuntu and wanted to know how to install opkg - think apt-get in Ubuntu, NO WAY! as there is no opkg or qt-embedded in Ubuntu and he had tried "sudo apt-get install qt-embedded".
I had to advise "sudo apt-get install qt4-default" and "apt-cache search qt4" in case additional packages were needed.

e.g Use "apt-cache search qt" in Ubuntu, "yum search qt" in Fedora, "zypper se qt" in openSUSE to see what is on offer. Using the Ubuntu full package names like libqt4-gui to search in any other distro yields nothing so search terms have to be truncated to something like qt or qt4 to find what you are after.

If you get comfortable using yum in Fedora, dnf which is available, is
set to obsolete it.

If you follow what's happening in Ubuntu, they are about to switch from
upstart to systemd which first Fedora did and later openSUSE. That's a
big change until you get familiar with it.
http://www.zdnet.com/after-linux-civil-war-ubuntu-to-adopt-systemd-7000026373/

openSUSE using wicked for network configuration I have just got used to.
I found early dracut only worked with openSUSE kernels so I backed off
to using mkinitrd for vanilla kernels, so another bash at dracut is on
my todo list.
What Ubuntu does is way off the scale compared to the others, mostly
different and bad but only occasionally good.

1228. Quisk on Windows

Yahoo group: n2adr-sdr
Date: 2014-07-03 22:26:19 UTC
From: Ron
Topic: 1228 Message: 1228
Attachments: 2 described; binary payloads are missing from this source WARC

Hi,

I posted the following message on the softrock40 group and received a response from Syd Boyce which I have also included in this post.

My original post to the softrock40 group:
/ I have finally gotten back to investigating using the Peaberry with Quisk. No joy yet. Quisk responds with "no permission to access softrock usb interface". This is on a Win 7 machine. All other SDR programs I have been using have no issues (HDSDR, PowerSDR, Rocky ...). I have obviously missed something as other users have been successful with Quisk on Windows. I have attached a screen shot and the configuration I am using.//
//Any ideas will be greatly appreciated. //
/
Syd's response:

/Looking at the Peaberry circuit diagram and the set up instructions it seems the USB connection appears as a sound card and si570 pretty much like the SDR-Widget.//
//With the SDR-Widget, python claims the USB for the sound card part and locks out access to the si570.//
//Jim does not have access to a SDR-Widget so he was unable to work on the problem to get access to composite USB devices - likewise with the Peaberry.//
//Whoever supplied the Peaberry config would be the appropriate person to ask. He may be named in the documentation.//
//With the SDR-Widget under Linux it was left with me to use the VK6JBL changes and the config file as a workaround.//
//I don't know if they will work with Windows.//
//I'm told that WinZip can extract .tgz files. Use quisk_conf.py_Softrock_UHFSDR as the template for the Peaberry quisk_conf.py (set si570_direct_control = True) and copy the stuff from the softrock directory to the softrock directory in quisk.//
//You can give it a try - under Linux I only ever used "si570_direct_control = False" and the usbsoftrock utility.//
/
/73 ... Sid. /

I have attached a screen shot of quisk reporting the error. Also attached is my quisk configuration. Other than what Syd has mentioned above, I am at a total lost as to what the next step(s) is. (David AE9RB , has indicated that quisk version 3.6.10 did work on Windows and perhaps regression may have occurred). I'm hoping someone on this board may have an insight as to how to correct this issue.

Thanks,

-- 73 Ron / W4MMP

1232. Re: Your standalone HiQSDR details please

Yahoo group: n2adr-sdr
Date: 2014-07-19 18:32:02 UTC
From: hgoebkes@...
Topic: 1230 Message: 1232

Hi Sid, Hi Group,

Stefan (DL2STG) has released his new Firmware (running with Quisk and RASDR) and
his new Version of RASDR.
Stefan is very busy so i try to explain some details here for a better understanding.

This Versions supports external user GPIO via SPI. SPI Interface is included
on the FPGA on pin 49 (spi_ss) pins 50 (spi_mosi) pin 51 (spi_miso) pin 52 (spi_clk)
This pins are connected to X2 connector (Aux I/O) at HiQSDR main board
Attention! Be carefull because all signals are 3.3V LVCMOS and directly connected to the
FPGA!
spi communication is done via 32 bit Frames (4Bytes)
containing address, controls and 16 Bits of data. The spi clock rate is 250kbit/sec
but usable up to 2 MBit/sec. Data changes are transferred
via small UDP packets all 10mS not to overload the RasPi
For a deeper look, consult Stefans AVR source or HiQGPIO "C" source code.

This released version is not the end of the game. just the first "light".

Currently it basically supports 3 Encoders (on high Resolution Encoder for frequency
adjustments
and two low-resolution encoders (16 Steps/rev) for menue selections and
currently one analog value connected to a potentiometer to adjust AF.
Stefan had implemented this for his own HiQSDR transceiver on a Arduino,
(See his beautiful TRX on his WebSite!) but this interface is running also on the
shortly available HiQGPIO Module (Microchip PIC18F76K22) wich supports
4 Encoders, 8 analog inputs (10 Bits Resolution), 8 digital switches/buttons
and 8 digital outputs. This HiQGPIO fits directly behind the front
of the HiQTRX-10 frontpanel and includes a small graphic LCD
for some informational readouts and the VFO Encoder with knob
(high resolution magnetic type, 128 Steps/rev)
The HiQGPIO contains also the interface to the HiPPA to get working parameters
from it via buffered I2C and a Serial Interface (RS-232)

RASDR is a very versatile GUI for HiQSDR and is also capable to run stand alone
on a raspberry pi with Linux supporting >= 7" grafical LCD connected to the HDMI
and allows stand alone operation without PC, only a cheap USB soundstick must be
connected to the RasPi.
RASDR do his job very sucessfully on a RasPi, all Filters loaded dynamically
in this mode, so the Raspi has no Problem to deal with Waterfall display, Sound & so on.
RASDR also has selectable FFT sizes and 2 AutoNotches as well as frequency Memorys.
All RX and TX Modes are supported, 2.Tone test signals are generated a.s.o.
The new Firmware & RASDR is written from Stefan, DL2STG (he has really done a very fine
Job!!)
supports dynamically loadable filter coefficents to support RASDR on RASPI
as well a full compatible mode for QUISK and other GUI's for HiQSDR.

He also had written a Interface to the HPSDR Protocol who allows the
HiQSDR to operate with PowerSDR too.

I am using a RasPi with a 7" LCD now for some month and this combination works perfectly.
I built this in a small desktop case and connect this "stand alone termínal" only via
Ethernet
and a 12Volt DC (POE should also be usable) to my HiQTRX-10 Station in a different
room (sometimes via WLAN) to do QSOs.

Schematics to connect the RASPI, LCD and further informations as well as
schematics of the HiQGPIO and the Firmware for HiQGPIO are released
shortly here in this Group.

Sorry to be quiet for a prolonged time, but we had a lot of work to make new
Modules and Software for HiQSDR available!

Helmut, DB1CC

Topic: 1230 Message: 1233

Thanks Helmut.
I already have rasdr-1.3.0 installed on an ODROID-X and ODROID-U3 and fpga_ver3-sg9.tgz up and running. I also have gpio.tgz but no STK500 so perhaps a ihex file could be made available along with the avr32 circuit. I have a stash of 128 Steps/rev rotary encoders somewhere around, the mechanical ones I can get from RS Components.

I also have a spare Raspberry Pi available or I could use the ODROID-X which is only a little larger.

I got a 7" touch screen from pollin.de. Touch works but no screen display from either Raspberry Pi or ODROID-X. They reckon the HDMI port won't work with either Raspberry Pi or ODROID and suggested using the DVI port with a DVI to HDMI adatper.

That does not work either and I am thinking it's either a fault on the controller board or the LCD itself.
No problem hooking those boards up to a large screenHDMI monitor.
73 ... Sid.

1235. Re: [n2adr-sdr] Re: Your standalone HiQSDR details please

Yahoo group: n2adr-sdr
Date: 2014-07-20 13:11:16 UTC
From: Sid Boyce
Topic: 1230 Message: 1235

Thanks Helmut,
I also reached the same conclusion after their suggestion of using a DVI to HDMI adapter didn't work.

PA3biy is also using an ODROID-U3 with the same LCD using the HDMI port and it works. He got it recently.
Mine is completely dead as it does not power up. I'll check the 2 voltage regulators on the board as Peter said he had them fail on the first one he received.

I told them it did not power up but this is what their techies suggested:-

Regarding to our technicians the new version of the displays cannot be connected to ODROID or Raspberry.

But it would work with a DVI-Adapter. (HDMI to DVI, for example our article 720967)

73 ... Sid.

Hi Sid,

my pollin display is working with my Cubieboard. There is no reason why it should not work. Do you have a chance to return it to Pollin for exchange ? Thats a pitti that it happens at your side since the shipment is far more expensive on your side than for germans.

regards
Mario

Hi Mario,
I sent an email over the weekend but have not yet received a reply.

Cost of shipping is not very expensive.
73 ... Sid.

1238. CW in PowerSDR with HpHiq

Yahoo group: n2adr-sdr
Date: 2014-08-18 22:50:22 UTC
From: Gena Pechen
Topic: 1238 Message: 1238

Hi friends,

I'm new in this group.

I tested my HIQSDR transceiver with PowerSDR and HpHiq tool. The radio is transmitting on SSB, but in CW mode has not RF signal and I don't hear sidetone. Is it bug HpHiq or it is my mistake? Any suggestions are welcome.

73 de Gena, EW1EA.

1239. Re: CW in PowerSDR with HpHiq

Yahoo group: n2adr-sdr
Date: 2014-08-19 01:12:46 UTC
From: gvjury@...
Topic: 1238 Message: 1239

Hi Gena,Welcome to the group. I send my CW from the HiQSDR board itself. When sending from my log software (CQRLog by OK2CQR) I simply parallel the output of my serial port to my keyer using open collector transistors. I use the sidetone from the keyer which stops me being confused by the latency of the network. If your HiQSDR is remote from your computer then yes it is necessary to run CW via the SDR. I am not much help here as I am Linux only and use Quisk and the radios by Stefan DL2STG.GL es 73 Graeme ZL2APV

1240. Quisk runtime error

Yahoo group: n2adr-sdr

You may have to do adjustments - I only had to adjust the VOX hold time.
Config --> TX Audio

My settings:
Audio level that triggers VOX -20dB
Time to hold VOX after end of audio 0.50 seconds
Clip 5
Preemphasis 0.70.
73 ... Sid.

From: gvjury@...
Topic: 1240 Message: 1244

Looks like the error was a one off and has not happened again. I asm wondering if I ran Quisk up too soon while booting the computer as of course things are still happening even though the screen looks normal.

Re the VOX my settings are

VOX Level = -11
Vox hold time = .88
Clipping = 15
Pre-emphasis = 0.75

Even with high clipping my audio reports are of higher than average quality.

I also get mysterious crashes but rarely and usually associated with browsing with Firefox. After restarting Quisk I have never had it crash again on the same session.

1246. Quisk on Odroid

Yahoo group: n2adr-sdr
Date: 2014-09-13 10:30:22 UTC
From: andrea montefusco
Topic: 1246 Message: 1246

Hi all,

asking here about Quisk on Odroid (maybe slightly off-topic).

I am doing some experiments with my Odroids (X2 and XU), running Quisk
and FunCube Pro+ @192kHz.

Whilst on XU Quisk is working quite well, on X2 the audio is
intermittently heard.

I already tried to comment out all the Quisk's drawing routines
(OnPaint methods), as I am using it without display, using an external
TX with tuning knob, but the performance improves only marginally.
I even compile using compiler options specific to ARM (the same we are
using in ghpsd3-alex project) and the CPU load diminish but the audio
is always not good.

Can someone suggest some compiler options and/or a recent system image for X2 ?
(Now it runs a very old Linaro 12.11)

Many thanks in advance

am

Are you trying to use the onboard sound or external ?

i can only get onboard sound for 2 seconds with my Odroid-X2 then stops with Quisk ... then i haft to close the program and open again.
..... ghpsdr3-alex (QtRadio) has no selection that i can get to work at all ....

Im using ArchLinux with the latest kernel (i think)

External USB sound works all day long .. iv been listening to WWVH for 4 days straight (day and nite) with no crashes ....

Does the X2 and XU use the same onboard sound ... i didn't look.

Bty .... how do you use Quisk with no display ? (im using a DL-165 because my HDMI is blown)

Internal.

> Bty .... how do you use Quisk with no display ? (im using a DL-165 because my HDMI is blown)

I created a configuration file that takes command from an external TX
via a USB/serial and drives Quisk and FCDPP local oscillator; tuning
and mode selection is done from TX.

Hi Andrea,
On-board sound has always been a problem - ODROID-X and ODROID-U3.
I have had it working fine, then I got intermittent sound and then it
stopped working so I am using USB sound card for RX and TX.

It's possible that introducing a HDMI switch has caused it to stop working.

root@odroidu3:~# cat /proc/asound/cards
0 [Audio ]: Built-in_Audio - Built-in Audio
Built-in Audio
1 [Aureon51MkII ]: USB-Audio - Aureon5.1MkII
TerraTec Aureon5.1MkII at usb-s5p-ehci-3.2.2.6,
full speed
root@odroidu3:~# uname -r
3.8.13.27

root@ODROID-X:~# cat /proc/asound/cards
0 [Audio ]: Built-in_Audio - Built-in Audio
Built-in Audio
1 [Device ]: USB-Audio - USB Sound Device
USB Sound Device at usb-s5p-ehci-2.2, full speed

root@ODROID-X:~# uname -r
3.8.13.23

All the controls show and are OK with alsamixer.
The ODROID kernels are the suspect as the MAX98090 is not as well
supported as in the upstream kernel.

Samsung has started ODROID universal support in 3.17-rc kernels. I have
built 3.17.0-rc2 and 3.17.0-rc3 zImage but I have seen nothing about it
on the ODROID forum.

Sid,

> On-board sound has always been a problem - ODROID-X and ODROID-U3.
> I have had it working fine, then I got intermittent sound and then it stopped working so I am using USB sound card for RX and TX.

I see.
I only mitigated the problem increasing the latency and reducing the polling frequency:

latency_millisecs = 1000
data_poll_usec = 200000

BTW, reducing the polling frequency carries as secondary benefit that the CPU load decrease as well.

I will try with some USB card, I only have at the moment an audio-widget but it is not working at all on Odroid-X2.

Is there a way to make that apply only to the on board sound ?

I did see that the latency for on board was 100X more than the USB sound seen in Quisk. That's nutz, it should be lower than the usb.

OK Andrea,
I didn't play with those figures.

The USB audio works fine.
I am only using 1 sound card for Mic/Spkr with the HiQSDR.

I expected the Audio Widget to work as UAC2 support went into mainline
kernel at 2.6.35.

Hi Group

Just a follow up to my occaisonal Quisk crashes. I have had a lot of Python updates so decided to recompile my Quisk 3.6.18 and since then no problems with crashes. I get a few messages when starting Quisk from a terminal relating to Jack not being installed on this machine so now very stable over last 24 hours.

```
gvj@gvj-Mint ~/Programs/quisk $ python quisk.py
ALSA lib pcm.c:2239:(snd_pcm_open_noupdate) Unknown PCM cards.pcm.rear
ALSA lib pcm.c:2239:(snd_pcm_open_noupdate) Unknown PCM cards.pcm.center_lfe
ALSA lib pcm.c:2239:(snd_pcm_open_noupdate) Unknown PCM cards.pcm.side
bt_audio_service_open: connect() failed: Connection refused (111)
bt_audio_service_open: connect() failed: Connection refused (111)
bt_audio_service_open: connect() failed: Connection refused (111)
bt_audio_service_open: connect() failed: Connection refused (111)
Cannot connect to server socket err = No such file or directory
Cannot connect to server request channel
jack server is not running or cannot be started
```

Tnx to all respondents, 73 Graeme ZL2APV

Topic: 1240 Message: 1258

I first saw these installing Crossover Office under KDE.
Codeweavers asked me to select something to do with the display which I can't remember and I can't find in the codeweavers forum.

That cured the Gtk-Critical messages but the real problem was a python library in /usr/local/lib64 which was hanging link which caused CXO program and quisk to fail to start.

The messages themselves never impacted the working of applications.
73 ... Sid.

1259. Change the IP address of the FPGA from the PC ?

Yahoo group: n2adr-sdr
Date: 2014-10-03 04:51:21 UTC
From: hans.brandl@...
Topic: 1259 Message: 1259

The firmware version 1.4 (and later ?) should allow to change the IP address of the FPGA from the PC instead of using the address programmed into the firmware.

Is there a ready to use program available to do so or where could I find details ?
Sorry , I was not successful until now by searching the net.

Hans

The config file option rx_udp_ip sets the IP address of the hardare when the hardware is version 1.4 or later. You can learn about config options by reading the file quisk_conf_defaults.py.

OK Jim,
Just to be absolutely clear as I had been asked this question -
So you are saying that the FPGA is no longer programmed with an IP
address of 192.168.2.196 and it solely depends on rx_udp_ip = "<IP_ADDRESS>"
73 ... Sid.

That is correct, provided sndp_active is True (the default). The following is from quisk_conf_defaults.py. All questions about config options should be answered in that file.

```
# For FPGA firmware version 1.4 and newer, the hardware is set to the rx_udp_ip you enter here.
# For older firmware, the IP address is programmed into the FPGA, and you must enter that address as rx_udp_ip.

rx_udp_ip = "192.168.2.196" # Sample source IP address
rx_udp_ip_netmask = '255.255.255.0' # The netmask for the network of rx_udp_ip
rx_udp_port = 0xBC77 # Sample source UDP port
rx_udp_clock = 122880000 # ADC sample rate in Hertz
sndp_active = True # Enable setting the hardware IP to rx_udp_ip
```

1265. Quisk Version 3.6.19

Yahoo group: n2adr-sdr
Date: 2014-10-27 19:40:26 UTC
From: jahlstr@...
Topic: 1265 Message: 1265

Quisk Version 3.6.19 October 2014

Mario, DL3LSM, contributed changes for MacOS support. Thanks!

I added device names to PulseAudio. The PulseAudio name "pulse" still refers to the default device. Otherwise, enter a PulseAudio name such as "pulse:alsa_input.pci-0000_00_1b.0.analog-stereo". See quisk_conf_defaults.py or docs.html. PulseAudio support enables you to connect to recent versions of wsjt-x. To turn this off, set show_pulse_audio_devices = False in your config file.

I have most of the bits, just waiting for the 2 mechanical encoders.

I put 4 stand-offs on the screen controller board and glued it to the
back of the LCD.

The screen is connected to the Raspberry Pi and I have the rasdr screen up.

Next I will program the AtMega32.

I need the userID and password so I can change the timezone. I tried
user pi and password raspberry.

1270. Re: Quisk Version 3.6.19

Yahoo group: n2adr-sdr
Date: 2014-11-11 12:05:39 UTC
From: dlrn36@...
Topic: 1265 Message: 1270
Attachments: 1 described; binary payloads are missing from this source WARC

Hi all,
I just upgraded my hiqsdr to firmware 1.4 so I could use alternative IP addresses. I also upgraded quisk from 3.6.8 to 3.6.19 as the IP selection didn't work with the older software.

Having upgraded to 3.6.19 quisk does see the board at the nominated IP address in the config file. However I'm getting very distorted audio, it appears to be an severely distorted echo with a delay of perhaps 1 second from the initial received signal.

I had the same problem with firmware 1.3 before upgrading and I "downgraded" quisk back to 3.6.8. But to use the new IP address I need to use the later 3.6.19 version as 3.6.8 doesn't appear to use those extra lines in the config file.

Has anyone else experienced audio problems/distortion with 3.6.19? I've attached a recording (apologies for the low audio level)

Thanks
Greg

With a bit more thinking time, the password, language, keyboard and timezone issues fixed.
password -- by removing the x in /etc/passwd and the password entries in /etc/shadow.

Helmut's circuit diagram is still needed.

1272. wxPython: stdout/stderr

Yahoo group: n2adr-sdr
Date: 2014-11-11 20:30:42 UTC
From: gvjury@...
Topic: 1272 Message: 1272

I got the following error which may be useful for debugging Jim.

```
Traceback (most recent call last):
File "/home/gvj/Programs/quisk/quisk.py", line 1540, in OnMotion
if self.mouse_is_rx: # Mouse motion changes the receive frequency
AttributeError: 'GraphScreen' object has no attribute 'mouse_is_rx'
```

1273. Mic gain changes

Yahoo group: n2adr-sdr
Date: 2014-11-11 20:41:50 UTC
From: gvjury@...
Topic: 1273 Message: 1273

I have a problem when running Quisk where something changes the system mic gain. I am using Xubuntu and adjust the mic gain in the sound settings applet to get the correct level in Quisk's Config/Tx Audio, Peak microphone audio level of around -5 dB. Something else I use sets the gain back to 100% and next time I use Quisk I am overdriving the audio and need to reset it. It does not always change even through re-boots.

I would like to know if there is a setting in Quisk where I can preset the system gain or maybe use a batch file to start Quisk where I preset the alsamixer mic gain.

Oh yes nearly forgot I am using alsa not pulse for my audio settings.
name_of_sound_play = "hw:0,0"
microphone_name = "hw:0,0"

mic_out_volume = 1.0

1274. Re: Mic gain changes

Yahoo group: n2adr-sdr
Date: 2014-11-11 21:31:01 UTC
From: jahlstr@...
Topic: 1273 Message: 1274

Quisk has a feature to adjust audio levels. Look for "mixer_settings" in quisk_conf_defaults.py. The documentation is there. You need to know the control number for the device you want to adjust, and this depends on your Linux version and audio hardware. Add your custom mixer_settings[] to your config file.

Jim

1275. Re: wxPython: stdout/stderr

Yahoo group: n2adr-sdr
Date: 2014-11-11 21:35:57 UTC
From: jahlstr@...
Topic: 1272 Message: 1275

That is odd. The mouse_is_rx is set when the left mouse button is pressed, and the mouse motion code (where the traceback is) only executes when the left button is down. What do you do that creates this traceback?

Jim

1276. Re: Mic gain changes

Yahoo group: n2adr-sdr
Date: 2014-11-12 00:15:27 UTC
From: gvjury@...
Topic: 1273 Message: 1276

Thanks Jim,

I should have looked harder and yes there is a great array of mixer names and I also have front and rear mic for the card so will need to sort out which one to use but at least you have shown me where to look. It may be

```
numid=18,iface=MIXER,name='Input Source'
; type=ENUMERATED,access=rw------,values=1,items=3
; Item #0 'Front Mic'
; Item #1 'Rear Mic'
; Item #2 'Line'
: values=0
or
numid=11,iface=MIXER,name='Front Mic Playback Volume'
; type=INTEGER,access=rw---R--,values=2,min=0,max=31,step=0
: values=0,0
| dBscale-min=-34.50dB,step=1.50dB,mute=0
or
numid=24,iface=MIXER,name='Front Mic Boost Volume'
; type=INTEGER,access=rw---R--,values=2,min=0,max=3,step=0
: values=3,3
| dBscale-min=0.00dB,step=10.00dB,mute=0
```

etc. Fiddling will tell :-)

1277. Re: wxPython: stdout/stderr

Yahoo group: n2adr-sdr
Date: 2014-11-12 00:20:14 UTC
From: gvjury@...
Topic: 1272 Message: 1277

Hmmm not sure exactly what I did but I think it was clicking the < > arrows to step up the band but I also clicked on the spectrogram to move frequency so could have been that. It has only happened once for me but I posted in case you had been chasing a bug which was very intermittent and the error may have been useful. Sorry I can't be more specific.

1278. Re: Quisk Version 3.6.19

Yahoo group: n2adr-sdr
Date: 2014-11-12 06:21:21 UTC
From: dlrn36@...
Topic: 1265 Message: 1278

Sorted.

I increased the latency setting in the quisk_config.py file. Increased it from 20 which was the default it came set at to 50. Working fine now (cross fingers)

Cheers
Greg

I removed ~/.config/sdr/rasdr.conf and get the same problem.
With svn, version 1.8.10 (r1615264) it fails on x86_64. "ldd rasdr" all OK.

With svn, version 1.8.8 (r1568071) on ARM it works.
Same message on ARM but rasdr does not segfault.

```

1283. Re: Mic gain changes

Yahoo group: n2adr-sdr
Date: 2014-11-18 03:40:42 UTC
From: gvjury@...
Topic: 1273 Message: 1283

Hi Jim,

There may be a bug in the gain settings. My alsa config as follows ...

```
gvj@gvj-Mint ~ $ amixer -c 0 contents | grep -A 5 "Capture V\|Capture S"
numid=21,iface=MIXER,name='Capture Switch'
; type=BOOLEAN,access=rw------,values=2
: values=on,on
numid=23,iface=MIXER,name='Capture Switch',index=1
; type=BOOLEAN,access=rw------,values=2
: values=on,off
numid=20,iface=MIXER,name='Capture Volume'
; type=INTEGER,access=rw---R--,values=2,min=0,max=31,step=0
: values=16,12
| dBscale-min=-13.50dB,step=1.50dB,mute=0
numid=22,iface=MIXER,name='Capture Volume',index=1
; type=INTEGER,access=rw---R--,values=2,min=0,max=31,step=0
: values=13,13
| dBscale-min=-13.50dB,step=1.50dB,mute=0
numid=30,iface=MIXER,name='IEC958 Default PCM Playback Switch'
; type=BOOLEAN,access=rw------,values=1
--
numid=44,iface=MIXER,name='Digital Capture Volume'
; type=INTEGER,access=rw---RW-,values=2,min=0,max=120,step=0
: values=60,60
| dBscale-min=-30.00dB,step=0.50dB,mute=0
numid=18,iface=MIXER,name='Input Source'
; type=ENUMERATED,access=rw------,values=1,items=3
gvj@gvj-Mint ~ $
```

I used numid=20 for volume and numid=21 for switch as follows ...

```
mixer_settings = [
("hw:0", 20, 0.6), # numid of microphone volume control, volume 0.0 to 1.0 (Capture
Volume);
("hw:0", 21, 1) # numid of capture on/off control, turn on with 1;
]
```

The problem is that using ("hw:0", 21, 1) always mutes the Capture Volume (and same for "hw:0", 21, 0) but I can set the mute just fine with "amixer -c 0 cset numid=21 1". My workaround is to use mixer settings as follows ...

```
mixer_settings = [
("hw:0", 20, 0.6) # numid of microphone volume control, volume 0.0 to 1.0 (Capture Volume);
# ("hw:0", 21, 1) # numid of capture on/off control, turn on with 1;
]
```

i.e. not worry about switching on the capture on/off control and I suspect the parameter "0 or 1" is not being parsed correctly.

Another issue I have is that I need to use pulse for microphone after issuing this command as no audio is being passed from the microphone. It used to work before but now needs to be started with pasuspender if I want to use alsa (not very important for microphone).

Hope this is of some help.

73, Graeme ZL2APV

1284. Re: Mic gain changes

Yahoo group: n2adr-sdr
Date: 2014-11-18 17:16:57 UTC
From: jahlstr@...
Topic: 1273 Message: 1284

Hello,

I think I see the problem. Your device 21 has two values, and quisk only sets the first one.

```
numid=21,iface=MIXER,name='Capture Switch'
; type=BOOLEAN,access=rw------,values=2
: values=on,on
```

The command
```
("hw:0", 21, 1) # numid of capture on/off control, turn on with 1;
```

would only set the first value to "on" and leave the second unchanged.

To test this idea, run your command
```
gvj@gvj-Mint ~ $ amixer -c 0 contents | grep -A 5 "Capture V\|Capture S"
```

before quisk starts to see the two values of control 21. Then run quisk, and without exiting, run the command again to see that quisk has changed the first but not the second (run amixer in a different terminal window). Also, quisk would only set the volume of the first index of device 20. Please test this and let me know what happens.

I presume the values are the right and left channel. So you may be able to work around this by reversing the left and right channel of the mic. I did not notice this because my mic was monophonic.

I will fix this in the next release, but if this interpretation is correct, I can send you a fixed version if you want.

Jim

Topic: 1273 Message: 1285

Hi Jim,

Thanks for looking into this so promptly. It is as you suspected in the case of the Capture Volume but the Capture Switch turns both off for some reason as shown below ...

Pre starting Quisk values

```
numid=21,iface=MIXER,name='Capture Switch'
; type=BOOLEAN,access=rw------,values=2
: values=on,on

numid=20,iface=MIXER,name='Capture Volume'
; type=INTEGER,access=rw---R--,values=2,min=0,max=31,step=0
: values=30,30
| dBscale-min=-13.50dB,step=1.50dB,mute=0
```

.quisk.conf.py mixer settings

```
mixer_settings = [
("hw:0", 20, 0.4), # numid of microphone volume control, volume 0.0 to 1.0 (Capture
Volume);
("hw:0", 21, 1) # numid of capture on/off control, turn on with 1;
]
```

Post starting Quisk values

```
numid=21,iface=MIXER,name='Capture Switch'
; type=BOOLEAN,access=rw------,values=2
: values=off,off

numid=20,iface=MIXER,name='Capture Volume'
; type=INTEGER,access=rw---R--,values=2,min=0,max=31,step=0
: values=12,0
| dBscale-min=-13.50dB,step=1.50dB,mute=0
```

Running amixer -c 0 cset numid=21 1,1 switches both channels on as follows ...

```
numid=21,iface=MIXER,name='Capture Switch'
; type=BOOLEAN,access=rw------,values=2
: values=on,on
```

Thanks for your kind offer of a special version for me but my workaround of assuming the switch will have been left on from the last application and simply not using that line is working for now and I can wait for the release but having said that I am always available to test a version for you if you want me to.

I can ping HiQSDR 192.168.2.196 but can't wake up rasdr.
"evtest /dev/input/event1" then switching to rasdr screen and touch
generates no events.

1289. Ham logger for Hiq SDR

Yahoo group: n2adr-sdr
Date: 2014-12-10 17:03:08 UTC
From: Gena Pechen
Topic: 1286 Message: 1289

Hi, friends,

Is there a ham logger program for Windows (except fldigi), which supports
data exchange (frequency, mode) with QUISK via XML-RPC?

Thanks in advance for the answers.

73! Gena, EW1EA.

1290. Re: Ham logger for Hiq SDR

$35, same as Raspberry Pi B+ with quad-core CPU, Gigabit Ethernet and
1GB memory.
I want one to replace the Pi for standalone HiQSDR.

Pollin.de has lots of gear for it but it's not yet available either from
them or hardkernel.com.

It's supposed to be available sometime later this month.

1293. ArmCortex waterfall issues

Yahoo group: n2adr-sdr
Date: 2014-12-12 01:18:47 UTC
From: Patriot121@...
Topic: 1293 Message: 1293

is this caued by not having python2.7-dev ??

self.display.OnGraphData(data[i1:i2], self.y_zero, self.y_scale) File "quisk.py", line 1856, in OnGraphData
bmp = wx.BitmapFromBuffer(len(row) // 4, 1, row)
File "/usr/lib/python2.7/dist- packages/wx-2.8-gtk2-unicode/ wx/_gdi.py", line 856, in BitmapFromBuffer
return _gdi_._BitmapFromBuffer(width, height, dataBuffer)
RuntimeError: Failed to gain raw access to bitmap data.
Traceback (most recent call last):
File "/usr/lib/python2.7/dist- packages/wx-2.8-gtk2-unicode/ wx/_core.py", line 14665, in <lambda>
lambda event: event.callable(*event.args, **event.kw http://event.kw))
File "quisk.py", line 4004, in OnReadSound
self.waterfall.OnGraphData(data) # save waterfall data
File "quisk.py", line 1921, in OnGraphData
self.pane2.OnGraphData(data)
File "quisk.py", line 1951, in OnGraphData
self.display.OnGraphData(data[i1:i2], self.y_zero, self.y_scale)
File "quisk.py", line 1856, in OnGraphData
bmp = wx.BitmapFromBuffer(len(row) // 4, 1, row)
File "/usr/lib/python2.7/dist- packages/wx-2.8-gtk2-unicode/ wx/_gdi.py", line 856, in BitmapFromBuffer
return _gdi_._BitmapFromBuffer(width, height, dataBuffer)
RuntimeError: Failed to gain raw access to bitmap data.

Seen that Sid found a part solution with

bmp = wx.BitmapFromBufferRGBA(len(row) // 4, 1, row)

but looks odd and the waterfall is off center ....

Im using a Imo touch2 (Displaylink driven) on a quad core Odroid (arm processor)

I found a blog about installing / running quisk after i came upstairs from the garage (AKA radio room) ... and im not sure if that package is installed .. or even relevent anymore ...

Sid was working on Ubuntu 12 an im running Ubuntu 14.04 ...

1294. Re: [n2adr-sdr] Re: Ham logger for Hiq SDR

Yahoo group: n2adr-sdr

From: Gena Pechen
Topic: 1286 Message: 1294

Hi, Mario,

All true, I did not find one program to my regret.
I guess that simple way to use the QUISK with any Windows ham logger --
program translator XML-RPC <--> virtual COM-port to data exchange. Perhaps
someone from programmers to write such a program.

73! Gena, EW1EA.

Hi Gena,

basically any software that can support hamlib should work. Not sure how
often hamlib is used for Win software.

From: Mike
Topic: 1295 Message: 1295

Hi ....

Im looking for where to change the frequency divide by when sending and retrieving the Si570 frequency ...

My RF front end is not divide by 4 but is divide by 2 .... and top end freq of 600mhz ...

I used to add a "-m2" to the end of the softrock call string .. but i think your using your own usb handling now ...

Topic: 1295 Message: 1296

Hello Mike,

The multiplication by four is hard wired into the file softrock/hardware_usb.py in the methods SetFreqByValue() and SetFreqByDirect(). You can change it there if you want.

Since your top frequency is 600 MHz I presume you are using a transverter, and need to subtract an offset. The next release will have this feature.

The easiest way to get what you want now is to write your own hardware file into your config file, and write a new ChangeFrequency() method. You would multiply the frequency by two before sending it to the Si570. And you could subtract the transverter offset too.

Jim

From: Mike
Topic: 1295 Message: 1297

No transverter .....

Im using a Si570 Class A .. its output can go to 1.476Ghz ... AND has a 180Deg output , so a divide by 2 is only needed for 90Deg Quadrature operation.

Ill look search for SetFreqByValue in hardware_usb.py ...

I looked there yesterday ... but was not sure what to do there .... didn't recognise the coding of a few years ago .. so i figured id wait for a response.

Ill let you know if i'm stumped.

Looking at the code.
def SetFreqByValue(self, freq):
freq = int(freq/1.0e6 * 2097152.0 * 4.0 + 0.5)
if freq <= 0:
return
s = UBYTE4.pack(freq)
try:
self.usb_dev.ctrl_transfer(OUT, 0x32, self.si570_i2c_address +
0x700, 0, s)
except usb.core.USBError:
if DEBUG: traceback.print_exc()
else:
return True
def SetFreqByDirect(self, freq): # Thanks to Ethan Blanton, KB8OJH
if freq == 0.0:
return False
# For now, find the minimum DCO speed that will give us the
# desired frequency; if we're slewing in the future, we want this
# to additionally yield an RFREQ ~= 512.
freq = int(freq * 4)

May be it needs to be:-
freq = int(freq * 2)

Yep .. thats what i found too ...

I tried first...

freq = int(freq/1.0e6 * 2097152.0 * 4.0 + 0.5)

to

freq = int(freq/1.0e6 * 2097152.0 * 2.0 + 0.5)

with no effect ...

Now to find the softwares frequency limitation ... looks like its limited to some where below 240Mhz ....(120Mhz ish) ...

The upper freq ranges fo rthe Class A Si570 didnt work ....

Didn't try usbsoftrock yet as a second test ....

My Si570 might be faulty too ... who knows .

I had a SDR-Widget which was not at that time being recognised by quisk as a composite device so I could only access the audio part - "You don't have sufficient permissions to access the ....", that was no access to the si570.

I had to use the VK6JBL changes but I think a fix for the Peaberry cured that but by the time that was known I didn't have the UHFSDR + Widget available to test.

With the VK6JBL changes I used this script to set per band division, run once and it was stored in EEPROM as Alex said, never found out if that was stored on the Widget or somewhere else.

```
------------------------ CUT -------------------------------
#!/bin/sh
usbsoftrock set si570_multiplier 0 0.5
usbsoftrock set si570_multiplier 1 0.5
usbsoftrock set si570_multiplier 2 0.5
usbsoftrock set si570_multiplier 3 0.5
usbsoftrock set si570_multiplier 4 0.5
usbsoftrock set si570_multiplier 5 0.5
usbsoftrock set si570_multiplier 6 0.5
usbsoftrock set si570_multiplier 7 0.5
usbsoftrock set si570_multiplier 8 0.5
------------------------ CUT -------------------------------
```

73 ... Sid.

I think thats set/saved in the flash of the AVR ... i probably will not
go that route ....
Id like to use the GPIO's of the Odroid to control the Si570 soon and
also control the band switchiong of my amps and BPF's ..... getting
close now ....
That big wait for onboard sound was a huge waste .... oh well .. my time
is cheaper than a FT-817ND ...(so my wife says -- hi hi)

I have band buttons set up for the rest of the ham bands ... i guess
N2ADR already set the USA band limits ... they are there and i didn't do
it ... i just changed some of the buttons ...

I don't know how to add more .. and when im in full screen the buttons
cover over the display slider gain controls ... not sure how to fix that.
Thats not all that high on my priority list ... full use of my Si570AAB
is right now on hte list.

then to get Tx operational ...

Not sure if my D-104 is going to be compatible with the mic input of a
CM-108 i just got (it was 1.10$USD) .... i got it cause its small ....

1306. Quisk Si570 max freq

Yahoo group: n2adr-sdr
Date: 2014-12-16 07:12:08 UTC
From: Mike
Topic: 1306 Message: 1306

Ok ... i don't see the difference yet in deriving the min "divide by"
comparing pe0fko's code and Jims .... (and Alex Lee)

The class "A" Si570 is saposed to have no limitations on division
combinations ....

usbsoftrock can set a freq of 490 (with -m2 switch) and recalled ok ....
my signal generator shows on the Quisk display when i do set the freq
with usbsoftrock ....so i don't have a hardware problem ....

From: Marciniak, Ed
Topic: 1306 Message: 1307

By design, there are gaps in coverage from 945-970.4 and 1134-1213 MHz due to the min/max VCO frequency range (4852-5670 mhz) and the first divider changing from /4 to /5 to /6.

I'd be curious☐ if anyone has tried say 1136 or 1152 MHz and found that it works with certain voltage/temperature range, or whether it is just plain locked out. Can anyone comment?

just did .... with usbsoftrock ....
those gaps are not programmable as far as i can see ...

Quisk seems to not be able to go past 440Mhz(Si570) or so .... so right now i manually enter a freq above 1.25M --- it must be done with usbsoftrock.

i think its a math issue.... unless a GDO outside the operational range is employed ...

I see the CFGSR has an option for that .... not sure if it works or how quick damage would ensue if went too far out .... i have only one Si570 Class A .. and i dont want to destroy it ...

1310. UHFSDR & Si570 & Quisk

Yahoo group: n2adr-sdr
Date: 2014-12-17 06:43:13 UTC
From: Mike
Topic: 1310 Message: 1310

Well ... sorry for the bandwidth ....

Ill start off as saying that i have a UHSDR with a Class "A" Si570 ...
it saposed to be good up to 1.41Ghz output ... mine is LVDS output.

Iv had a bit of a problem for a while of not being able to use anything
above 1.25M hamband for some reason.
I knew that usbsoftrock would set higher frequencies .... just not why.

I think i found the answer tonight .... and i hope Jim is ok with me
posting the change to hardware_usb.py in the softrock folder ....

actually i made 2 changes .. but ill get to the other later for users of
divide by 2 Rf front ends ...

im not sure what line number right now .... but its about 3/4 the way down.

```
# For now, find the minimum DCO speed that will give us the
# desired frequency; if we're slewing in the future, we want this
# to additionally yield an RFREQ ~= 512.
freq = int(freq * 4)
dco_new = None
hsdiv_new = 0
n1_new = 0
for hsdiv in SI570_HSDIV_VALUES:
n1 = int(math.ceil(SI570_MIN_DCO / (freq * hsdiv)))
if n1 < 1:
n1 = 1
else: <::::::: Remark
me with a "#" at the beginning of this line
n1 = ((n1 + 1) / 2) * 2 <::::::: Remark me with a
"#" at the beginning of this line
dco = (freq * 1.0) * hsdiv * n1
```

I know what the "else:" is doing here in this code area ...
but not
n1 = ((n1 + 1) / 2) * 2

If n1 was 1.1 from the previous code --- with wanting a freq of 940Mhz ...

n1 = int(math.ceil(SI570_MIN_DCO / (freq * hsdiv)))
4.85ghz / ((940Ghz * 4)
note: 4 is the lowest hsdiv you can have

then n1= 1.289893617 (BEFORE math.ceil FUNCTION IS USED)

n1= 1 after math.ceil FUNCTION IS USED (i had to go look it up ... lol)

so in equation n1 = ((n1 + 1) / 2) * 2 where
n1 = ((1+1)/2)*2
n1 = ((2) /2)*2
n1 = (1)*2
n1 = 2 ..... n1 started as 1 and when ever n1
is below 2 , it will be recalc'ed back up to 2

So ... when the DCO freq is checked in the last line .... it will always
be outside the Min / Max DCO frequency limits ... if you had a Si570
class A OR B !!!(BTY .. dont spend the extra money on the Class "A"
Si570 .. you don't need it)

with n1 being pushed to 2 when ever its below 2 the max freq the Si570
can output is 606.5Mhz .... thats 303Mhz with a /2 Rf front end.

Or my reasoning is totally messed up ... but this did work for me !!!!!

YMMV !!!!!!

recheck ... i misread what math.ceil does ....

a math.ceil check rounds up ..... 1.2 will return a 2 ....

the n1 = ((n1 + 1) / 2) * 2 still seems goofy to me ....

a freq of 970Mhz is with in a valid range with a hsdiv of 5 ....

Anyways .. its late and i should be asleep ....

I found my other change for the UHFSDR ....

changed

```
freq = int(freq * 4)
dco_new = None
hsdiv_new = 0
n1_new = 0
for hsdiv in SI570_HSDIV_VALUES:
```

to

```
freq = int(freq * 2)
```

1313. Re: [n2adr-sdr] Touch not working - Raspberry Pi, Saint Smart 7" touchscreen and dl2stg's image

Yahoo group: n2adr-sdr
Date: 2014-12-24 17:19:47 UTC
From: Sid Boyce
Topic: 1286 Message: 1313

No response in nearly a month.

I tried debian wheezy but could not get the touchscreen axes correct by any of the methods I tried including "SwapAxes" "1" in /etc/X11/xorg.conf.d/99-calibration.conf and adding the same to /usr/share/X11/xorg.conf.d/10-evdev.conf as shown below.

```
Section "InputClass"
Identifier "evdev touchscreen catchall"
MatchIsTouchscreen "on"
MatchDevicePath "/dev/input/event*"
Driver "evdev"
SwapAxes "1"
EndSection
```

I also copied 01-input.conf to /etc/X11/xorg.conf.d/ and also tried with renaming it to 99-calibration.conf.

so I burned a new radsr_1.3.0.img and I am back to the original problem where the device is not shown in /dev/input/by-id and touch does not work.

I tried the alterations I made on debian wheezy and it still doesn't work.

1314. Re: [n2adr-sdr] Touch not working - Raspberry Pi, Saint Smart 7" touchscreen and dl2stg's image

Yahoo group: n2adr-sdr
Date: 2014-12-25 22:35:41 UTC
From: Sid Boyce
Topic: 1286 Message: 1314

I went back to my debian wheezy SD card which shows in /dev/input/by-id
lrwxrwxrwx 1 root root 9 Jan 1 1970
usb-eGalax_Inc._USB_TouchController-event-if00 -> ../event0

Ran "xinput_calibrator" and copied the output to
/etc/X11/xorg.conf.d/99-calibration.conf, suddenly it's working as it
should.
The only difference I could see was in the figures it generated.
73 ... Sid.

1315. Quisk 3.6.20

Yahoo group: n2adr-sdr
Date: 2014-12-31 18:10:05 UTC
From: jahlstr@...
Topic: 1315 Message: 1315

Thanks to Graeme, ZL2APV, quisk now changes both channels of a control when using mixer_settings[]. He reports that setting boolean values does not work, but it works on my machine. More testing is needed.

The new config file dictionary bandTransverterOffset[] gives the offset in Hertz for bands that are used with a transverter; for example 144000000 - 28000000 for a two meter transverter. This currently works for HiQSDR, SoftRock and SdrIQ. I also changed the graph X axis code so gigahertz frequency labels are not too wide.

1316. Re: [n2adr-sdr] Quisk 3.6.20

What do you think about repeater offset's for 2M and the like ....
The split can only split in the Rx bandwidth ... i think.

I was thinking that making the FM button have a pop up ... kinda like
the agc has but you enter what offset you would like .. positive or
negative ....

just my wishful thinking ...

Hi Jim,

Thanks for the work on quisk. I guess you are wondering why I have not reported the results at my QTH but very sorry I am touring in our caravan since 12th Dec. With only a cell phone and won't be home until 20th January. Will test out then, although I guess you will have all the information you need by this time.

Happy New Year, Graeme zl2apv

1318. tx_level attribute error

Yahoo group: n2adr-sdr

From: dl3hc@...
Topic: 1318 Message: 1318

Hello Group,

does someone ever had the following error?
The tx_level attribute is set in the config file (.quisk_conf.py) but i still get this error!

File "/usr/lib/python2.7/dist-packages/quisk/hiqsdr/quisk_hardware.py", line 150, in SetTxLevel
reduc = self.application.tx_level
AttributeError: 'App' object has no attribute 'tx_level'

73, Chris

From: jahlstr@...
Topic: 1318 Message: 1321

Hi,

I presume you are using the HiQSDR hardware file.

I guess this is caused by a missing dictionary tx_level in your config file.You need a dictionary that includes a key for None. See quisk_conf_defaults.py for an example. There is a different level for each band, and the level for None is the default.

```
tx_level = {None:120, '60':110}
```

Hi Jim,
yes, the used Hardware is the HiQSDR. The dictionary tx_level is in the config file. The line looks exactly like this: tx_level = {None:120, '60':110} But it always stops at this point with the forementioned error.

In the meantime i removed quisk, downloaded the source from your Homepage and recompiled it for use on my 64bit system. It compiled without errors. But now there is a new problem. If i start quisk from the command line, nothing happens. It just doesn't start.
Is there a possibility to debug?
RegardsChris, DL3HC

Betreff: Re: [n2adr-sdr] Re: tx_level attribute error

Hi Jim,
yes, the used Hardware is the HiQSDR. The dictionary tx_level is in the config file. The line looks exactly like this: tx_level = {None:120, '60':110} But it always stops at this point with the forementioned error.

In the meantime i removed quisk, downloaded the source from your Homepage and recompiled it for use on my 64bit system. It compiled without errors. But now there is a new problem. If i start quisk from the command line, nothing happens. It just doesn't start.
Is there a possibility to debug?
RegardsChris, DL3HC

Hi,
I presume you are using the HiQSDR hardware file.
I guess this is caused by a missing dictionary tx_level in your config file.You need a dictionary that includes a key for None. See quisk_conf_defaults.py for an example. There is a different level for each band, and the level for None is the default.
tx_level = {None:120, '60':110}

Hello,

Regarding Quisk not starting after you compiled for your 64-bit Linux, it is essential that Quisk is compiled in the same way that Python was compiled. Even on a 64-bit Linux, Python is usually compiled as a 32-bit app. Please try to compile Quisk 32-bit, and try that. Actually, the binaries for Quisk, Python, wx, fftw3 etc. must all be compiled the same way (32 or 64 bit). But when I made the same error, I got the message "bad ELF class", and I am not sure why you don't get that message if this is the problem.

Also, make sure you start Quisk with Python 2.7, not Python 3.

Your tx_level entry in your config file is correct. There may be a phase error in my code, but I don't know why it doesn't happen on my system. Try adding this line to quisk.py:

```
def OnInit(self):
"""Perform most initialization of the app here (called by wxPython on startup)."""
self.tx_level = 100 # Add this line
wx.lib.colourdb.updateColourDB() # Add additional color names
```

The tx_level for the application is different from tx_level in the config file.

Jim

I have no problems on x86_64 - openSUSE, Kubuntu 14.10, Kubuntu 15.04
nor on ODROID-u3 Ubuntu 14.10.

The default on all distros I have seen is python2.7 even with python 3
installed and python2.7 is used by default.
root@odroidu3:/opt/quisk-3.6.20# python --version
Python 2.7.8

I did have one problem on ODROID-U3 with no sound but found pulseaudio
was not running.

I have had the touch working correctly on the raspbian image.

I had to copy across /etc/inittab from the rasdr_1.3.0.img so it boots
up and runs rasdr.

The AtMega32p is programmed but could do with help to figure out the
connections.

Looking at the code only the rotary encoder connections are obvious.

1328. hiqsdr 3rd nyquist

Yahoo group: n2adr-sdr
Date: 2015-01-30 07:56:25 UTC
From: dlrn36@...
Topic: 1328 Message: 1328

Hi all,
I have a HIQSDR which I only use for reception and I live VERY close to a number of AM broadcast transmitters. To deal with those I built a cauer elliptic high pass filter and it's the only filter inline. I don't typically visit the broadcast band, but recently I did and I noticed some signals come and go which I found peculiar for the AM broadcast band.

I was able to catch one of them and found myself listening to aircraft approach radio for the airport. A quick calculation shows that 122.88 + 0.8xx put me in the air band.

I note there isn't an anti aliasing filter before the ADC and I'm wondering .... Given the bandwidth of the ADC is 750MHz and the LTC6405 is 2.7GHz, operating in the 2nd through to the 5th nyquist zones should be possible albeit with worse spurious performance as indicated by the 5500 datasheet and some need to alter the software to know which zone it's in. And the ADT4-6T is only specified to 300MHz but appears to work beyond that.

Of course sensitivity and dynamic range will be reduced due to the sample hold sinc function with about 12dB loss for the 2nd zone, 22dB for the 3rd, and 30db or so for the 4th. Reception up to 70cm should be plausible although along with the loss in sensitivity would be a reduction in dynamic range if an LNA were incorporated to counter the loss.

I'm thinking about making a bandpass filter/amplifier for the 3rd (2m) zone and was curious to know if anyone has already used the sdr in those zones? If you have what was performance like?

And of course if the DAC were replaced with one that can operate in the 3rd zone then TXing at 2m would be possible too. :)

Cheers
Greg

Hello Group,

i would like to do some audio processing for ssb with a software audio chain. is there a way to disable the audio processing in QUISK. it also seems that QUISK limits the transmitted audio to 2.4 kHz. does this happen in quisk or in the fpga? is it possible to widen that transmit filter bandwidth?

best regards
Chris, DL3HC

Hi Christian,

the 2.4kHz audio is a limitation of Quisk as far as i remember. I once used HiQSDR for some DRM radio transmission with 10kHz bandwith together with the Gnuradio stuff from Stefan, DL2STG:
HiQSDR DL2STG http://dl2stg.de/stefan/hiqsdr/gnuradio.html

http://dl2stg.de/stefan/hiqsdr/gnuradio.html

HiQSDR DL2STG http://dl2stg.de/stefan/hiqsdr/gnuradio.html gr-hiqsdr gr-hiqsdr is a extension to make HiQSDR usable with GNU Radio. After installing you will find two new modules: HiQSDR sink and HiQSDR source.

View on dl2stg.de http://dl2stg.de/stefan/hiqsdr/gnuradio.html
Preview by Yahoo

His FPGA image also supports higher TX rates.

regards
Mario, DH5YM

1333. 2nd Mic Input for Quisk ?

Yahoo group: n2adr-sdr
Date: 2015-03-02 09:34:18 UTC
From: dh5ym@...
Topic: 1333 Message: 1333

Hi Jim,

hope you read here. Currently i try to make my HiQSDR setup ready for SSB contest usage. I faced some trouble to get voice keyer working with Quisk.
Do you think its possible to have a second audio input to Quisk used for Voice keyer operation ? This would make life much more easy if the audio from a voice keyer can be fed to Quisk via a separate input. It would even make usage of a loopback device possible.
Using the VOX function only for the voice keyer input only could even save the PTT cable.

regards
Mario

1334. normalization of SSB audio source ?

Yahoo group: n2adr-sdr
Date: 2015-03-05 21:20:48 UTC
From: dh5ym@...
Topic: 1334 Message: 1334

Hi,

i tried to get my SSB audio working clean but was not successfull so far.
It seems that in the sequences were i do not speak into the microphone the noise level is amplified just like with an AGC. When i speak the noise gets lower. I observed my own signal in FDX mode.
Does anyone else see the same or am i doing something wrong ?
If its really a kind of normalization in Quisk, can that be switched off ?

regards
Mario

Hi guys,
Diagrams still not seen.

Today I was comparing Stefan's cabling with mine on my QRZ.com page and see some differences, i.e, X3 is cabled on Stefan's.

I don't have the Arduino connected so X2 is currently unused.

Touch is working.

The one problem which may be rasdr/cabling related, I get no RF out from the 10W PA but TX appears to be functioning in CW and SSB.

I'll do some more checks by connecting to the 192.168.2.x LAN and checking TX still gives output.
73 ... Sid.

Hi guys!
Im use HIQSDR (mini v2)
Say please, how to set LO frequency and how to use this with 28 to 144 MHz transverter? How quisk software defined use transverter?
I see in conf file
freq_spacing = 116000000
freq_base = 0
But, I don't see 2m freq on display.

1337. Status on HIQSDR

Hi All

What is the current status on the DDC/DUC HIQSDR Radio?. Seems that there is not so much happening on the yahoo group or any updates on the web pages. I guess the HIQ developers are busy and making modules etc. My HIQSDR project has been idle for some time now and I was thinking about the HiQTRX-10.
However the 100 watt PA with new enclosure and front panel is still on my wish list :-)
Any updates please.

Hi,

you need to add your transverter band to every band specific entry in the quisk_conf.
I have an example for 23cm:

```
#exciter output scaling
tx_level = {None:255,'160':170, '80':120, '40':105, '30':110, '20':70, '17':110, '15':110,
'12':110, '10':140, '6':250, '60':90, 'TRV':230}

#definition which path of the preselector unit should be taken (0=bypass)
HiQSDR_BandDict = {'160':1, '80':2, '40':3, '30':4, '20':5, '17':6, '15':7, '12':8,
'10':9, '6':10, 'TRV':0 }

#definition for the band edges
BandEdge = {
'160':( 1800000, 2000000),
'80' :( 3500000, 3800000),
'40' :( 7000000, 7200000),
'30' :(10100000, 10150000),
'20' :(14000000, 14350000),
'17' :(18068000, 18168000),
'15' :(21000000, 21450000),
'12' :(24890000, 24990000),
'10' :(28000000, 29700000),
'6' :(50000000, 54000000),
'TRV':(1296000000, 1300000000),
}

#default setting for each band when switching between the bands
bandState = {'Audio':(0, 0, 'LSB'),
'160':( 1890000, -10000, 'LSB'),
'80' :( 3660000, -10000, 'LSB'),
'40' :( 7100000, -0, 'LSB'),
'30':(10120000, -10000, 'CWL'),
'20' :(14200000, -10000, 'USB'),
'17' :(18120000, 10000, 'USB'),
'15':(21250000, -10000, 'USB'),
'12' :(24940000, 10000, 'USB'),
'10' :(28400000, -10000, 'USB'),
'Time':( 5000000, 0, 'AM'),
'6' :(50040000, 10000, 'USB'),
'TRV' :(1296190000, 10000, 'USB'),
}

#label for the band selection button in the GUI
bandLabels = ['Audio', '160', '80', '40', '30', '20', '17', '15', '12', '10', '6', 'TRV',
```

```
('Time',) * len(bandTime)]

#define the transverter offset
bandTransverterOffset = {
'TRV': 1296000000 - 29000000
}

i copied only the entries that are relevant...

Hope this helps.

regards
Mario

Hello Mario,

I just got back from a long ski vacation, thus the late reply.

By "voice keyer" do you mean a source of recorded messages, such as "CQ CQ"? So it would be necessary to mix the recordings with the actual mic?

Topic: 1334 Message: 1344

Hello Mario,

Yes, Quisk has an AGC feature for the mic input which tries to maintain a constant input audio level. So if you don't talk, the gain increases. This only happens when PTT is down. One solution to to raise PTT when not talking.

The amount of gain increase is set to 20 dB by the mic_min_level parameter in microphone.c. This parameter is not adjustable.

If this is a problem for you, I could make mic_min_level a parameter in the config file. Then you could limit the amount of gain increase. But some amount of mic AGC seems essential so that loud sounds (wow! a VK9X!) don't clip and soft sounds don't reduce the Tx power.

Hi Jim,

yes, a CQ loop is what i mean.
It would be ok, if only one source is played. Actually it would be better just to play one since the microphone should not be played during CQ. My idea was that the CQ source is usually without background noise in the gaps between the CQ (since its played from a file) and therefore a VOX can be easily used. If this source is active the normal microphone can be switched off. Then its even possible to do CQ loops without extra PTT cables.

Hi Jim,

for the moment i used this as it is and it seems there was no problem on the band. However i think it would be good to have this parameter adjustable since the spectrum seems to get somehow wide by the noise raising up in the speech gaps.

From: dh5ym@...
Topic: 1348 Message: 1348

some further points that i noticed during microwave contest operation last weekend:

- the CW tone during TX should be easily adjustable. For my opinion it was too loud and i wanted to reduce it but did not manage to do so. It would be nice to have a slider somewhere in the settings menu.
- the split option is a pretty cool feature. I used to search for unworked stations in the reception phases of my CQ loop while still listen to my calling frequency. The handling of this feature could be improved by two things:
1) a checkbox that locks the TX frequency so that clicking to the frequency scale always changes the frequency of the 2nd RX and never the 1st-RX / TX frequency.
2) a button or key combination that swaps the 1st/TX and the 2nd frequencies so that you can easily work a station on the 2nd frequency and then switch back to the CQ frequency

I made a small adaption to Quisk in order to make the CW-keyoff-delay in the FPGA version of DL2STG usable. Its just a very minor change but i guess it could cause problems with the images from Jim since a byte that is intended to be set to 0 is not 0 anymore. I think it should be possible to make these settings usable in the DL2STG design conditional.

Hello Chris,

Quisk audio processing is not in the FPGA, it is in the PC in the file microphone.c. There are two modules. One is used for the microphone, and uses AGC, clipping and filtering to process the audio. The other is used for playing recordings and digital modes, and uses minimal processing. The bandwidth of each is fixed.

I can add a new feature to do what you want, but what is it you are trying to do? Do you have IQ samples?

Hello Mario,

One way to do this is to mix the microphone with the recorded file before Quisk, and apply the sum to the Quisk microphone input. If your sound recording is analog, that only requires an analog mixer. If it is digital, then it may be possible to use the digital mixer in your sound card, or a sound server like PulseAudio.

An alternative would be to play the sound file from Quisk. That would require more control buttons. But I already have a request to play files from Quisk, so maybe that would work if you can create a 48 ksps WAV file to be played from Quisk.

Please describe in more detail what you are trying to do.

Hello Jim,
thanks for your reply. I want to experiment with audio processing to enhance the ssb audio with a software audio chain via VST plugins. The problem with that is that all you do before in the audio chain is useless when it runs through quisk because it seems the bandwidth will always be reduced to 2.4 kHz. I tried to find where that happens in the source code but could not find it although i expected it to be in the microphone.c file. Also the AGC is a problem sometimes like Mario has already noted.

Best regardsChris

Attachments: 1 described; binary payloads are missing from this source WARC

Hi Jim,

what i want to do is the following:
Some logging software has capabilities to play CQ loops in CW and SSB. For CW the keying is generated via a RS232 and for SSB the audio is played from file and PTT is generated via a RS232.
That one i would like to connect to Quisk. So far i did that by a small switchbox that can route audio signal from microphone or from the log PC to the PC that runs quisk. However that does not work with every soundcard since some automatically switch to the internal microphone if it detects that the external one has been switched away. Furthermore i would like to avoid the cabling for PTT and audio.
What i had in mind was to route the CQ audio from the log PC to Quisk via network (or via loopback if Quisk and the log run on the same PC) and to use VOX for the CQ audio to avoid the PTT line.
Then the microphone could connect to the one audio input and the CQ audio connect to another audio input. If there is audio with sufficient level present at the CQ input it should switch to this input and automatically switch to TX. If the PTT is pressed manually the microphone input should be selected.
Mixing the audio was not my favourite way since then you still need the PTT cable (since you do not want to work on VOX during a contest) and you always have the microphone switched on which is very annoying at a multi op station.
About playing a WAV for CQ loops:
Thats also a possibility but its the less comfortable one. You could make a functionality were a WAV is played cyclic with configurable gaps in between (for listening). That could be started by a button or a hotkey (as the configurable hotkey for PTT). If the PTT is keyed the CQ loop should always be stopped immediately.
The disadvantage is that you cannot start the CQ loop out of the log software but you have to touch the Quisk PC. But this solution would be ok as well.

I attached a picture how my cable connections were setup last time. The green lines are audio connections. That gives an impression how it currently looks like ;)

regards
Mario

Hello Mario,

First, I need to know that pushing the PTT button in Quisk will set your station to Tx. In my shack, that does not work. I must use a toggle switch to change to Tx. If pushing the PTT button does not change everything to Tx, you will still need the PTT cable.

I do not like adding another sound card for the CQ audio from the logging program. Quisk already has seven sound interfaces, and managing all these and polling each for I/O is already a problem. If you add a mic preamp to your shack, you can mix the mic and CQ audio to a single line-in to a soundcard with no problems. You will still need the PTT cable.

Adding a feature to Quisk to play WAV files is a better solution. Quisk can push PTT and play a WAV file on a timer.

Thank you for pointing out that you do not want to use VOX during a contest. I did not know that.

Also, I always thought that Quisk would make a great contest station. A new signal is smeared out at the top of the waterfall, and you can then pounce on it.

Hello Chris,

If you want to completely control the Tx audio, you must provide I/Q audio at baseband. This is not a simple thing. A simpler option is to provide monophonic audio, and let Quisk do some processing, perhaps at a wider bandwidth.

Will you provide I/Q audio or monophonic audio?

Hi Jim, basically the provided audio will be monophonic. The Setup looks like this: Microphone -> Soundcard IN -> Audio processing via VST Plugins (Noise Gate, EQ, Compressor etc.) -> Virtual Audio Cable -> QUISK. The problem then is the limited bandwidth and maybe the further processing that Quisk does. I don't know if changing the bandwidth alone would solve the problem? What i observed is that for example EQing the audio will not be audible neither on HF nor whithin the playback function in Quisk. 73 de ChrisDL3HC

Hello Chris,

I studied the code some more, and I have a solution. Use the digital input instead of the mic input for your audio. That is, send your audio to digital_input_name, and select a digital mode for transmit. You will also want to set digital_tx_level to 100.

The digital inputs bypass the mic processing. The filter passband is 300 to 5000 Hertz, and the DGT-IQ method does not even have a filter. You will have to provide all your own audio processing, including setting the volume level.

If this doesn't do what you want, please let me know, and I will try to get something else done before the next release.

Hi Jim,

in my station all equipment connected to the HiQSDR will be set to TX by the PTT output of the preselector PCB. So pushing the PTT button in the GUI can set the complete equipment to TX.

I understand your point about adding another audio interface.
Would it be also a problem to re-use a interface that is already existing ? The Digital modes audio interface would be a good candidate since its anyway unused during SSB operation. Switching to DGTL mode and to TX if there is a checkbox set and some audio present on this interface. Maybe that is also useful for digital mode operation.

However, the WAV playback feature is also a good solution and together with automatic looping, interruption by PTT and maybe a separate hotkey function for starting the CQ loop would be a great feature.

Another, completely different question: In the code i saw some words about dx-cluster support. Is this stuff already working ? What does it do ? What came to my mind was that this might be used to set the mid frequency of a CWSkimmer connected to the baseband sample interface via the skimmer/qsy command. First i thought this could be done by a simple skript that reads the frequency via hamlib but there is no chance to get the mid frequency of the spectrum, just the working frequency.

regards
Mario

Hello Mario,

Regarding the sidetone volume, if your hardware file sets use_sidetone to true, there should be a slider labeled "STo" on the left side of Quisk to adjust the sidetone volume. Is this slider missing, or does it not work? Or maybe "STo" is not a clear label.

Oh, i think its usefull for presenting skimmer spots of a local CW skimmer. You can connect the CW Skimmer via the baseband IQ interface of Quisk and get the spots via a telnet interface that has a dx-cluster behavior. Then you directly get the calls written to the lines you see in your waterfall. With the bandmap of your log software you can then jump from one to another ;)

Quisk can now transmit a message from a WAV file. Record your message at a high level (near clipping) at 48 ksps, 16-bit, one channel (monophonic). Then enter the file name on the Config/Config screen. Press the "File play" button to transmit. Quisk will press the PTT button for you, and release it during pauses. To interrupt playback, press PTT or release FilePlay so you can answer.

The "Split" button has been replaced with a "Splt" button and a "Rev" button. The "Splt" button splits Rx and Tx; and if you click it with the right mouse button instead of the left, it also locks the Tx frequency so tuning changes the Rx frequency. The "Rev" button reverses the Tx and Rx frequencies. These features were suggested by Mario, DH5YM.

I added a new parameter mic_agc_level to the config file to control the mic AGC. Input levels below mic_agc_level are ignored. The default is 0.1. Increase this (up to 1.0) to reduce the AGC range, and reduce it to increase the AGC mic gain boost.

Philip Lee contributed a patch to the PulseAudio code to set the play buffer size.

No. The Tx and Rx frequencies must be within the display bandwidth.

The split/revert feature is a really cool thing. Just the rightclick for setting the RX frequency did not work on the Win7 machine i have here. I will try with Linux this evening. For the playback file and return rate, is there any parameter for preconfiguring that in the config file (default) ?

Hi Jim,

i tried on my Xubuntu system at home.
The split/rev feature is really nice. Thats very useful for contest operation and searching for unworked stations between the CQ calls. Tuning the 2nd RX works not as i would have expected from your description. If i rightclick to the spectrum the TX frequency is set to the frequency i rightclicked. The mid frequency of the available spectrum is also set to this frequency (means LO = TX frequency) and the offset of the 2nd RX to the TX is maintained.

regards
Mario

Yes, you can set the default file names in the config file. This is from quisk_conf_defaults.py:

```
# Quisk can save radio sound and samples to files, and can play recorded sound. There is a button on the
# Config/Config screen to set the file names. You can set the initial names with these variables:
file_name_audio = ""
#file_name_audio = "/home/jim/tmp/qaudio.wav"
file_name_samples = ""
#file_name_samples = "C:/tmp/qsamples.wav"
# The file for playback must be 48 ksps, 16-bit, one channel (monophonic); the same as the mic input. When
# you play a file, the PTT button (if any) is pushed. There is a control to repeat the playback. This
# feature is intended to transmit a "CQ CQ" message, for example, during a contest.
file_name_playback = ""
#file_name_playback = "/home/jim/sounds/cqcq_contest.wav"
```

The right-click feature is not on the screen display. You must right-click the "Splt" button to lock the transmit frequency. The label will change to "LkSp" to remind you that split is locked.

From: jahlstr@...
Topic: 1369 Message: 1369

FreeDV is the combination of the codec2 codec and the fdmdv modem. It provides digital voice in 1200 Hz bandwidth suitable for HF transmission. You can use FreeDV by downloading the FreeDv program from freedv.org, and connecting it to Quisk using the usual digital mode DGT-U. But now there is a simpler way. Quisk has a new mode button FDV. Just push the FDV mode and talk. See http://www.rowetel.com/blog/?page_id=452.

Quisk will add the FDV mode button unless your config file contains the line
add_freedv_button = 0
If there is a problem with the freedv module, the button will be grayed out. See README.txt in the freedvpkg subdirectory for more information. The "Split" button currently fails with FDV.

With the mouse in the frequency display, roll the mouse wheel to change the digit.

The new config option hamlib_ip specifies the Hamlib IP address; default "localhost".

The IMD button now has a right-click level control like the Spot button. This is more convenient than having a few fixed levels.

The Spot button can now transmit a carrier at zero amplitude. This is useful for testing the output noise. If you wrote your own OnSpot() method, level -1 is now Spot button off, and the level is now 0 to 1000.

Hi Jim,

i got it working on my Ubuntu x64 machine.
I downloaded your updated package. Following the readme file in the freedvpkg package did the job at least almost.
Installing speex dev package with sudo apt-get install libspeexdsp-dev
change to the codec2 build directory, cmake ../ and make
Then cd back to the freedvpkg directory and copy the library with cp codec2/build_linux/src/libcodec2.so .
Then its necessary to run make again in the freedvpkg directory in order to build the module.
Without this last step the button was still grayed out. However the test described in the readme to check if the module is operational does not work here. Still i was able to use the freedv within Quisk. I decoded my own signal loopback in FDX mode of the Hiqsdr. The SNR shown was just 7dB. I have to look into that further. But it works at least.
If the freedvpkg is not assumed to change every release of quisk i suggest to provide that as a separate download. Quisk itsself is just about 1 MByte and the freedv stuff is 10MByte ;)

Thank you very much for your work ! Now i have to find someone for testing.

regards
Mario

Hi Mario,
I'll see if I can get some time over the weekend to replace codec2 with codec2-dev for quisk-3.6.22 and ghpsdr3-alex.

The codec2 list gave 14.236MHz as the 20m frequency.
How much activity there is is unknown.

Perhaps through the codec2 list someone could arrange to do a test with you.

Mario, I forgot to ask you. Did you try to run FDV after downloading; that is, without re-compiling? Did it not work? I have 32-bit Linux, not 64-bit. But if Quisk is 32-bit, then 32-bit compiles are necessary, so I thought that my 32-bit shared library would work without re-compiling.

Hi Jim,

my system is x64. Thats probably the issue. The 32bit binaries do not work. So i have to run make before starting. And without building the FDV stuff its not working then.

I think that explains the differences in behavior.

Hi Jim,

Again many thanks for the new version of Quisk. I see that you are using codec2-dev in your new version and remembering back to other posts on this topic in other groups I got the impression that codec2-dev was a development version which may have bugs or not even work at any particular point and for stable production codec2 should be used. I think all the headers are there as it compiles into ghpsdr3-alex with no problems and works well. I don't know if you have run into this issue or not and I could be barking up the wrong tree but thought I would bring it to your attention just in case. It is going to cause some clashes if I need to install both codec2 and codec2-dev so when I am sure which to use will go that way.

Topic: 1369 Message: 1380

That was the recommendation some months ago when the code was reorganized.

What used to be codec2-dev became codec2 (stable branch) and the new
development branch was started as codec2-dev with the warning that the
code was subject to large changes and that it may or may not work.

I/we have been using codec2 with ghpsdr3-alex.
Before I updated the wiki some guys were installing codec2-dev and
referring to it as codec2. That caused some confusion as it kept
bellyaching about not finding libspeex.

Running make, freedv.so gets built with the codec2 library.
slipstream:/opt/quisk-3.6.22 # ldd freedvpkg/freedv.so
linux-vdso.so.1 (0x00007fff647f1000)
libm.so.6 => /lib64/libm.so.6 (0x00007ffb9783f000)
libcodec2.so.0.3 => /usr/local/lib64/libcodec2.so.0.3
(0x00007ffb975df000)
libpython2.7.so.1.0 => /usr/lib64/libpython2.7.so.1.0

libdl.so.2 => /lib64/libdl.so.2 (0x00007ffb96a67000)
libutil.so.1 => /lib64/libutil.so.1 (0x00007ffb9685f000)
/lib64/ld-linux-x86-64.so.2 (0x0000558132407000)

When I start up quisk (no hardware attached) the icon is greyed out.
May be a longer read will explain something I missed.
"python setup.py install" does nothing with freedv.so.

Hello Graeme,

You are right that codec2-dev is the experimental branch. But when I downloaded codec2, the API files freedv_api.c and freedv_api.h were missing, so I was forced to use codec2-dev. But in my design, the files live in quisk/freedvpkg/codec2, and are not installed in Linux. So I don't think there will be a conflict. You can choose to use any codec2 version you want. See freedvpkg/README.txt.

And if digital voice is anything like the many other digital modes, it will be a moving target, and interested users will have to update their codec2 more often than I release a new version. I think the directions in freedvpkg/README.txt will provide a relatively painless way to do that.

Not every Quisk user will be interested in FreeDV, and I tried to minimize the impact for them. The original quisk-.tgz file was 10 megs, but the newest version is 1.6 megs. That is bigger than the old 1.1 meg, but not too bad. And it is acceptable to simply delete the freedvpkg directory with no problems. I didn't want to require that codec2 be present to compile Quisk. Quisk compiles fine whether or not codec2 code is present.

We will see if codec2 and FreeDV become popular. Meanwhile it is fun. I have met some very nice people on 14.236. Most of the changes to Quisk are confined to code in freedvpkg, so if FreeDV fades away, so will freedvpkg.

Hello Sid,

If the FDV button is grayed out, there is something wrong with the binaries. For example, libcodec2 could be 32-bit, but you have a 64-bit Python. The Quisk "make" will not make a new freedv. You need to "cd quisk/freedvpkg" and "make". If that fails, you need a new libcodec2.so.

I have been working on the files distributed with Quisk. The 3.6.22 version from today May 1, 2015 is different (and smaller), and the freedvpkg/README.txt file is different. But if you have an older 3.6.22, you should still be fine.

As far as I can tell, Speex is not required for the codec2 library, even though the codec2 people say it is needed. I removed Speex from my distribution. It appears that Speex is needed for some unit test utilities.

Thanks Jim,

I should have guessed you would be a jump ahead of me and again thanks for the explanation and the extra work you have done to make it easier to set up FreeDV. I don't know if you have ever looked at the Google Hermes-Lite group but there is discussion on making the Hermes-Lite compatible with HiQSDR as well as Hermes as some of us have discovered how well thought out and intuitive Quisk is and now the recent revelation that we can code an interface with Quisk for Hermes anyway. I have never written a line of Python before but maybe I should have a go although I am reluctant to take on yet another project with so many languishing on my bench.

Cheers, Graeme ZL2APV

Hi Jim,

I had a go at FreeDV again but still no luck but I did not exactly follow your instructions as I already have Codec2 inatalled on my system

1. From freedvpkg I deleted libcodec2.*
2. Copied libcodec2.* from my codec2/build/src to freedvpkg
3. ran make with output below

```
gvj@gvj-Mint ~/Programs/quisk/freedvpkg $ make
python setup.py build_ext --force --inplace
running build_ext
building 'freedv' extension
x86_64-linux-gnu-gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv -O2 -Wall
-Wstrict-prototypes -fPIC -I. -I.. -I./codec2/src -I/usr/include/python2.7 -c
../import_quisk_api.c -o build/temp.linux-x86_64-2.7/../import_quisk_api.o
x86_64-linux-gnu-gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv -O2 -Wall
-Wstrict-prototypes -fPIC -I. -I.. -I./codec2/src -I/usr/include/python2.7 -c freedv.c -o
build/temp.linux-x86_64-2.7/freedv.o
x86_64-linux-gnu-gcc -pthread -shared -Wl,-O1 -Wl,-Bsymbolic-functions
-Wl,-Bsymbolic-functions -Wl,-z,relro -fno-strict-aliasing -DNDEBUG -g -fwrapv -O2 -Wall
-Wstrict-prototypes -D_FORTIFY_SOURCE=2 -g -fstack-protector --param=ssp-buffer-size=4
-Wformat -Werror=format-security build/temp.linux-x86_64-2.7/../import_quisk_api.o
build/temp.linux-x86_64-2.7/freedv.o -L. -Wl,-R./freedvpkg -lm -lcodec2 -o
/home/gvj/Programs/quisk/freedvpkg/freedv.so
gvj@gvj-Mint ~/Programs/quisk/freedvpkg $gvj@gvj-Mint ~/Programs/quisk/freedvpkg $ make
python setup.py build_ext --force --inplace
running build_ext
building 'freedv' extension
x86_64-linux-gnu-gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv -O2 -Wall
-Wstrict-prototypes -fPIC -I. -I.. -I./codec2/src -I/usr/include/python2.7 -c
../import_quisk_api.c -o build/temp.linux-x86_64-2.7/../import_quisk_api.o
x86_64-linux-gnu-gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv -O2 -Wall
-Wstrict-prototypes -fPIC -I. -I.. -I./codec2/src -I/usr/include/python2.7 -c freedv.c -o
build/temp.linux-x86_64-2.7/freedv.o
x86_64-linux-gnu-gcc -pthread -shared -Wl,-O1 -Wl,-Bsymbolic-functions
-Wl,-Bsymbolic-functions -Wl,-z,relro -fno-strict-aliasing -DNDEBUG -g -fwrapv -O2 -Wall
-Wstrict-prototypes -D_FORTIFY_SOURCE=2 -g -fstack-protector --param=ssp-buffer-size=4
-Wformat -Werror=format-security build/temp.linux-x86_64-2.7/../import_quisk_api.o
build/temp.linux-x86_64-2.7/freedv.o -L. -Wl,-R./freedvpkg -lm -lcodec2 -o
/home/gvj/Programs/quisk/freedvpkg/freedv.so
gvj@gvj-Mint ~/Programs/quisk/freedvpkg $
```

FreeDV was still greyed out on quisk so I ran the python freedv import test

```
Python 2.7.6 (default, Mar 22 2014, 22:59:56)
[GCC 4.8.2] on linux2
Type "help", "copyright", "credits" or "license" for more information.
>>> from freedvpkg import freedv
Traceback (most recent call last):
File "<stdin>", line 1, in <module>
ImportError: freedvpkg/freedv.so: undefined symbol: freedv_nin
>>> freedv.set_options()
Traceback (most recent call last):
File "<stdin>", line 1, in <module>
NameError: name 'freedv' is not defined
>>>
```

I would not have expected to have to do a fresh install of codec2 and am surprised this did not work. I wonder if you have any suggestions and please don't waste too much time on me as I am happy to do a new install if necessary.

Hi Jim,
Kubuntu 15.04
root@sdrbox:/opt/quisk-3.6.22/freedvpkg# file freedv.so
freedv.so: ELF 64-bit LSB shared object, x86-64, version 1 (SYSV),
dynamically linked,
BuildID[sha1]=86988eea606183b870c42381cf4cd4c2e525007e, not stripped

from freedvpkg import freedv
freedv.available() # This should return 1
Says no module available.

from freedvpkg import freedv
###freedv.available() # This should return 1
All looks good, FDV-U not greyed out.

Using codec2-dev as freedvpkg/codec2
codec2-dev also installed system wide, QtRadio which was built with
codec2 works without recompiling.
73 ... Sid.

From: jahlstr@...
Topic: 1369 Message: 1393

Hello Graeme,

This is very interesting. I think the problem is that you have an existing incompatible libcodec2. Remember that when I downloaded codec2 source, the API files freedv_api.[ch] were missing, so I used codec2-dev. The entry freedv_nin is defined in freedv_api.c, and your error messages claim it is missing.

My distribution assumes that codec2 is in freedvpkg/codec2. Then freedvpkg/freedv.c is compiled using the *.h files in codec2/src and the codec2 library from codec2/build_linux/src. This is OK up to this point.

But when the freedv module runs, it searches for libcodec2.so using the Linux search order, and I think it is finding your existing libcodec2.so before it finds mine. Then it fails, because it needs the newer version.

There is probably a way to force freedv.so to use freedvpkg/libcodec2.so, but I don't know how to do that. I can barely remember how Linux searches for shared libraries. Anyway, if you have codec2 installed on your system, my build procedure is wrong.

If you have a valid codec2 installed on your system, you should proceed as follows. First remove freedvpkg/codec2. This is a precaution against mixed versions. Then run "make" in freedvpkg. This should work, because the codec2 header files are somewhere in /usr/include, and the compiler will find them (maybe). Then the link will work because the library is somewhere in /usr/lib or /usr/local/lib, and the system will find it. Then my freedv will use your codec2 when it runs, because the system will find the libraries it used for the link.

This procedure is correct philosophically, but it will likely fail because your codec2 is not recent, and you will need to update. But then it will work. I think codec2 will be a moving target, and those that use it will need to update frequently.

I am happy to work with you on this. I want FreeDV to work, and I want to prevent problems for those who do not wish to use it.

Hi Sid,

The undefined freedv_nin means that you are using an older codec2 without the freedv_api files. See my post on what to do if you have codec2 installed.

The Speex files are not needed (today) by codec2. They are only used by some Unit Test modules. Try using "make codec2" instead of "make" to make only libcodec2.so.

This test in Python:

```
python
>>> from freedvpkg import freedv
>>> freedv.set_options()
1
>>>
```

succeeds, and means that the freedv module was found, and that the codec2 shared library was found too. But if the FDV button is grayed out, it means that the subsequent open() failed, or that API functions from freedv_api.c are missing. Please see my other posts on this topic.

I am sorry I did not think about having codec2 already installed. I did not find any Ubuntu package for it, and I just assumed I had to include it. But I will work on this until it is perfect.

Actually, my worst fear was causing Quisk to fail if there was something wrong with freedv or codec2. So having problems with codec2, and yet having Quisk keep working with a grayed out FDV button is actually good news!

Hello Graeme,

Thank for pointing me to the Hermes-Lite project. I looks very interesting. I thought the original Hermes project used USB, but the Hermes-Lite photo I saw showed an Ethernet connection. If it uses Ethernet, it is probably easy to make Quisk work with it. Most code would be in C with a little Python.

Topic: 1369 Message: 1397

Hi Jim,

Glad you looked at the project. In its present MKI form it uses an Altera sdk which plugs onto a small board with the A/D converter and from there to another board with some RF stuff like baluns, filters etc. Without postage it is ~ $100 so in the Softrock price range and within the capabilities of the average builder. It covers LF to 30 MHz so not as wide as HiQSDR but has good performance and runs with PowerSDR and John Melton's other software including the Android phone app. The MKII version already being planned will include the fpga on board and low cost simple is still the prime target. Now Quisk is being very seriously considered as part of the suite.

Back to topic after my diversion. The gnu-radio project can also install codec2 from the Ubuntu ppa although I do not have that option installed in my system. It looks like codec2 needs its own ppa for a standard Ubuntu install but as it is a moving target that probably won't happen for a while. I will get the most recent version installed to get rid of that possible error and repeat my first try and when it fails implement your suggestions and see what happens.

I think codec2 needs to be installed as a stand alone and all software which uses it should find the binaries and libs in the usual places in the standard install paths. I need to find where codec2 installs to and I know that wherever it is, ghpsdr3-alex finds and runs correctly so Quisk should be able to do the same. I installed my version of codec2 in my ~/Programs/codec2 directory and created a build directory under that before "make"

Hermes and Hermes-Lite both use Ethernet and Altera FPGA's.

The Hermes FPGA is the same as used in the HiQSDR, just with a greater number of LE's, likewise the ADC/DAC are higher spec'd versions of the ones used in HiQSDR.

With the Linux programs for Hermes/Hermes-Lite, HiQSDR gets detected but obviously doesn't work as Hermes command set is different.

1400. Port of Quisk to OS X

Yahoo group: n2adr-sdr
Date: 2015-05-02 23:19:42 UTC
From: Jean-Paul Louis
Topic: 1400 Message: 1400

Hello everyone.
With time passing, I am getting more used to OS X, and was wondering if anybody succeeded to port Quisk to OS X. I am using Yosemite on a MacBook Pro.
In the past, I always failed to compile because of the Audio interface.

Any pointer will be appreciated.

I updated my system, updated MacPorts,
Downloaded the latest tarsal of quick, untared,
then ran “make”

here is what I got which exactly what I always get when I try to build:

```
Jean-Pauls-MacBook-Pro-7:quisk-3.6.22 jean-paullouis$ make
python setup.py build_ext --force --inplace
running build_ext
building 'quisk._quisk' extension

I cannot figure out where to get the required “port audio.h” file.

Hi,

Portaudio is a audio library available for several operation systems. You need the development package. Under linux its called portaudio-dev. The portaudio.h is part of that.

regards
Mario

Hello,

You wrote:
>>I think codec2 needs to be installed as a stand alone and all software which uses it should find the binaries and libs in the usual places in the standard install paths.

I agree, but there is no codec2 Ubuntu package to install. Unless the install is easy, I need to include a codec2.

I think if codec2 is installed in the usual place, Quisk will use it instead of my version, and everything will work. Otherwise you can delete freedvpkg/codec2 to make sure the local version is used.

Yep .. what i remember there is no package under Ubuntu for codec2 ....

Needs to be retrieved with subverson .... probably other ways .. this is
the way i last did it (pulled from ghpsdr3-alex install pages)

svn co https://freetel.svn.sourceforge.net/svnroot/freetel/codec2

From: Jean-Paul Louis
Topic: 1400 Message: 1407

I made a little progress, but is seems that clang choke on most of the code in sound_portaudio.c

I copied the two files (port audio.h and pa_mac_core.h in the same directory as sound_portaudio.c, and I got the new set of errors.
I moved the line #include “port audio.h” after the #include “quick.h"

Here is what I am getting now:

```
Jean-Pauls-MacBook-Pro-7:quisk-3.6.22 jean-paullouis$ make

Well shoot ....

I downloaded the latest quisk .. and wanted to make my previous changes
before exploring the digital voice ... but darned if i cant remember
what file i changed ....
I should of included that info too i guess .... i thought it was
quisk.py .... but i cant find the lines of code to change.

any one recognise the code ?

Ill keep looking ... i found it quickly when i first tried .... now
bumpkiss ....

I tried in a slightly diferent way .. might of not got all what was needed .... but ..

I moved libcodec2.* to the freedvpkg folder of quisk .... and did a make there .... (following some read.me)

Didnt see an error, but i didnt do a make install either.. not sure if i needed to do that ... but right now the digital voice button is still grey ...

```
odroid@odroid:~/Downloads/quisk/freedvpkg$ sudo mv
/usr/local/lib/arm-linux-gnueabihf/libcodec2.* .
odroid@odroid:~/Downloads/quisk/freedvpkg$ ls
README.txt __init__.pyc codec2 freedv.pyd libcodec2.so makefile
__init__.py build freedv.c freedv.so libcodec2.so.0.3 setup.py
odroid@odroid:~/Downloads/quisk/freedvpkg$ make
python setup.py build_ext --force --inplace
running build_ext

Also i used a slightly older version of codec2 .... like 3 months old by now ....

Probably would not of hurt to just built the one that was packed with quisk .... i just didn't want to mess up my install of ghpsdr3-alex --- which on hind sight, iv not used for 3 months .... go figure.

like another has said/asked .. if quisk could just do a 600Khz split !!!

From: Sid Boyce
Topic: 1310 Message: 1412

There are some powerful search tools available.

"grep" is your friend when searching for strings, e.g

```
root@odroidu3:/opt/quisk-3.6.22# grep -r dco_new *
softrock/hardware_usb.py: dco_new = None
softrock/hardware_usb.py: if not dco_new or dco < dco_new:
softrock/hardware_usb.py: dco_new = dco
softrock/hardware_usb.py: if not dco_new:
softrock/hardware_usb.py: rfreq = dco_new / self.conf.si570_xtal_freq
root@odroidu3:/opt/quisk-3.6.22#
```

That says search recursively for the word dco_new in files in the
current directory and subdirectories.
"grep -ir" for ignore case. dco_new, dco_n or dco_ne will yield the same
results.

Searching for files - e.g "mlocate qmake" will list every instance of
files with qmake in their names on your system.

mlocate.updatedb is run by crondaily to create a database of all files
in a system so that mlocate can spew out a list speedily rather than the
long wait using the find command.
73 ... Sid.

All Good ... In the quisk directory do make or "pthon setup.py install".
In the config file - ~/.quisk_conf.py or whatever

from softrock import quisk_hardware
quisk_widgets = None

from freedvpkg import freedv
73 ... Sid.

ghpsdr3-alex built with codec2 earlier and tested with codec2-dev later
without rebuilding still works.
QtRadio built with codec2 at 19:54
codec2-dev built and installed at 22:34

root@odroidu3:/opt/quisk-3.6.22# ls -l /usr/local/bin/QtRadio
-rwxr-xr-x 1 root root 6950433 may 5 19:54 /usr/local/bin/QtRadio

root@odroidu3:/opt/quisk-3.6.22# ls -l
/usr/local/lib/arm-linux-gnueabihf/libcodec2.so.0.3
-rw-r--r-- 1 root root 514494 may 5 22:34
/usr/local/lib/arm-linux-gnueabihf/libcodec2.so.0.3
73 ... Sid.

If you copy libcodec2.* to Quisk, overwrite the Quisk version. It is either in freedvpkg, or in freedvpkg/codec2/build_linux/src. It depends on which version of Quisk you have.

There is no "install" step for the Quisk libcodec2. The libcodec2 is somewhere under freedvpkg. I didn't want to interfere with other versions of libcodec2 on your system.

The PortAudio and PulseAudio systems are optional. Did you compile Alsa successfully? If so, you have a working audio system. The file sound_directx.c has dummy versions of PortAudio and PulseAudio. You could copy this code into your own file, and just use Alsa for sound.

Hi Jim,
I was under the impression that ALSA is not supported on Mac OS X.
I might be wrong as usual.
I will check if ALSA is available, and report here.

Thanks,
Jean-Paul

```
i tried "from freedvpkg import freedv" in .quisk_conf.py but got this
error, i didnt use "from softrock import quisk_hardware
quisk_widgets = None" because i was not sure if it would conflict ....

and i shut the odroid down while i was taking out the trash .. and cant
ssh into it to ve\rify if it would actually cause problems .... oh well.

1420. Re: [n2adr-sdr] Port of Quisk to OS X

Yahoo group: n2adr-sdr
Date: 2015-05-06 08:57:33 UTC
From: Mario Illgen
Topic: 1400 Message: 1420

Hi Jean-Paul,

I'm following this conversation for some days.. As I've setup a new iMac with Yosemite some weeks ago I took some time to compile quisk again documenting the steps needed.. I have used quisk only with HiQSDR hardware and SDR-IQ so I don't know if it works with Softrock etc.. Hope I cover it all in this mail..

First you should have Xcode and the command line tools for Xcode.
I use MacPorts for most of the libraries so the following relates to MacPorts.

The following libraries you need:
- FTDI direct driver (ftd2xx) for OSX from:
http://www.ftdichip.com/Drivers/D2XX.htm
- X11 for OSX from: http://xquartz.macosforge.org
- OSX only supports portaudio:
$ sudo port install portaudio
- FFTW
$ sudo port install fftw-3
- Python 2.7
$ sudo port install python27
- select this python version
$ sudo port select --set python python27
- wxPython
$ sudo port install py27-wxpython-2.8

As Macports installs in /opt/local you need to set the environment accordingly:
$ export LDFLAGS='-L/opt/local/lib'
$ export CPPFLAGS='-I/opt/local/include'
and then:
$ make

There are some warnings but no errors.

Before using quisk you should edit you config file ~/.quisk_conf.py according to your hardware etc. Make sure you use PortAudio devices like so:
name_of_sound_play = "portaudio:Built-in Output"
microphone_name = "portaudio:Built-in Microph“

And then you should be able to start it:
$ python quisk.py

Hope this helps..

73 de Mario, DL3LSM

P.S. Maybe someone with access to the HiQSDR Wiki could put this there??

P.S. One thing I forgot in my post - you have to edit sound_portaudio.c to include a dummy replacement for "quisk_pa_sound_devices" inside/at the end the OSX part (__MACH__)

```
#if defined(__MACH__)

...

PyObject * quisk_pa_sound_devices(PyObject * self, PyObject * args)
{ // Return a list of PulseAudio device names [pycapt, pyplay]
PyObject * pylist, * pycapt, * pyplay;

if (!PyArg_ParseTuple (args, ""))
return NULL;
pylist = PyList_New(0); // list [pycapt, pyplay]
pycapt = PyList_New(0); // list of capture devices
pyplay = PyList_New(0); // list of play devices
PyList_Append(pylist, pycapt);
PyList_Append(pylist, pyplay);
return pylist;
}

#endif
```

Hello Mike,

You must not put "from freedvpkg import freedv" in your config file. It is only a test that you type into a python terminal window to test your setup.

Jim

OK .. did you write the readme in freedvpkg folder?

i tried to follow it and this is the first error i got ...

```
odroid@odroid:~/Downloads/quisk/freedvpkg/codec2/build_linux$ cmake
-DCMAKE_BUILD_TYPE=Release -DUNITTEST=OFF ../
CMake Error: The source directory
"/home/odroid/Downloads/quisk/freedvpkg/codec2" does not appear to
contain CMakeLists.txt.
Specify --help for usage, or press the help button on the CMake GUI.
```

and codec2 did not contain a CmakeLists.txt file ....

i have an older D/L on another computer (intell) that does contain that file ... so i guess it got omitted recently.....

Hi Mario,

Thank you for the information you just provided in the last two emails.
I am going to follow your procedure, and report results here.

Thanks again, and 73 de Jean-Paul

Hi Mike,
That's on n ODROID-U3.

AOK on Kubuntu 15.04 x86_64 and Ubuntu 14.04 on ODROID-U3.

On openSUSE the speex header problem for codec2-dev build I have been notified bug has been assigned, no other response so far.

On Ubuntu ARM 14.04 and Kubuntu 15.04 upgrades changed /etc/pulse/daemon.conf causing no audio on QtRadio, reason - pulseaudio was not being launched as a daemon.

Updated "Enable Pulseaudio Daemon to run in system wide mode" wiki section in
http://napan.ca/ghpsdr3/index.php/Pulseaudio_Setup.
73 ... Sid.

You can not make a codec2 in freedvpkg/codec2 because I removed the codec2 source to make my distribution smaller. With the codec2 source, it is 10 times larger. Just download a codec2 and build there.

Hi Sid!
No, in Windows many hamlog connect to transceiver via com port(RS232). QUISK SDR it is transceiver. I'm insert small part of code into quisk.py and now I can connect our log software or other via com port to QUISK SDR. I connect QUISK SRD with UCXLog via virtual com port (com0com). If you create standalone transceiver based on QUISK software, there is an opportunity connect our PC with software to this. This is can be: hamlog, mixw, fldigi, or other software. In Russia, into hamradio sphere linux is not based system, but I can't find software for windows can support hamlib.

Thanks Nick,
I'll have a look at quisk.py when your code is added, perhaps in 3.6.23?

On the hermes-lite google group it was asked for support of
Hermes-Lite/Hermes support in quisk and I am trying to figure out how to
do it with my limited python coding skills.

Hopefully someone will get around to porting PowerSDR to Linux using
mono. There are a few differences between mono and C♯ but AD0ES has
successfully converted fldigi as flradio to run under mono on Linux.

Interesting times.
73 ... Sid.

AD0ES I think changed mono code to substitute code for .NET Winforms and
flradio compiled and runs.
http://ad0es.net/flprogs/ flrig and fldigi-3.22.05-sdr.1.0.8.tgz
<http://ad0es.net/flprogs/flradio/files/fldigi-3.22.05-sdr.1.0.8.tgz>
exploded to add files to fldigi-3.22.05.
Details in the file INSTALL-SDR.

Patches for quisk are usually sent to Jim jahlstr@....
73 ... Sid.

1440. quisk Fldigi and Odroid

Yahoo group: n2adr-sdr
Date: 2015-06-02 21:48:59 UTC
From: Mike
Topic: 1440 Message: 1440

any one using quisk Fldigi and Odroid (arm7) ..... ??

i tried the 2 lines of

```
digital_input_name = "hw:Loopback,0"
digital_output_name = digital_input_name
```

but quisk hangs for some reason .....

Somewhat involved and I don't have the same ODROID.

I can detail a process for building and installing a new kernel
"uname -a" ?
"df -h" to see how many GB of space you have if you don't have a USB HD.
The kernel source requires 2.5GB.

"ls -l /proc/config.gz" does it exist?

"sudo apt-get install kernel-package"

I am about to boot a ODROID-U3 kernel configured with Konsole output
CONFIG_SND_ALOOP=m

It's a 3.8.13.30 kernel that I built as 3.8.13.301 by changing the
Makefile so I don't lose the ability to go back to 3.8.13.30.

Konsole output
linux-headers-3.8.13.301_3.8.13.301-10.00.Custom_armhf.deb

Konsole output
linux-image-3.8.13.301_3.8.13.301-10.00.Custom_armhf.deb

Real glad it works ....

have you tried quisk and fldigi to see if the loopback does not cause
any issues ?

From: Sid Boyce
Topic: 1440 Message: 1448

I haven't but I see no reason why it shouldn't be OK.

I have the HiQSDR running standalone using a Raspberry Pi model B and 7" touchscreen so I'll reconfigure it to run quisk from the ODROID-U3 and test.
73 ... Sid.

1449. Re: [n2adr-sdr] quisk Fldigi and Odroid

Yahoo group: n2adr-sdr
Date: 2015-06-03 20:24:01 UTC
From: Sid Boyce
Topic: 1440 Message: 1449

```
Konsole output
git clone --depth 1 git://github.com/hardkernel/linux.git -b odroid-3.8.y

mv linux linux-3.8.13.301
cd linux-3.8.13.301
edit Makefile and change EXTRAVERSION = .30 to .301

Konsole output
VERSION = 3
PATCHLEVEL = 8
SUBLEVEL = 13
EXTRAVERSION = .301

cp /proc/config.gz .
gzip -d config.gz
mv config .config

edit .config and change the line
# CONFIG_SND_ALOOP is not set
to
CONFIG_SND_ALOOP=m

make oldconfig

make-kpkg -j 4 --initrd linux_headers linux_image

When it's all done, the 2 .deb packages are built
cp arch/arm/boot/zImage /media/boot/zImage-3.8.13.301

dpkg -i ../linux-headers-3.8.13.301_3.8.13.301-10.00.Custom_armhf.deb
../linux-image-3.8.13.301_3.8.13.301-10.00.Custom_armhf.deb

Konsole output
mkimage-A arm -T ramdisk -C none -n "uInitrd" -d
/boot/initrd.img-3.8.13.301 /media/boot/uInitrd-3.8.13.301

Backup 3.8.13.30 files. If not root use sudo.
-------------------------------------------------------
cd /media/boot
cp zImage zImage-3.8.13.30
cp uInitrd uInitrd-3.8.13.30

cp zImage-3.8.13.301 zImage
cp uInitrd-3.8.13.301 uInitrd

sync;sync
```

reboot and you are up and running on the new -X2 kernel.
Konsole output
uname -r
3.8.13.301

modprobe snd-aloop
Loopback should show as an additional sound card.
Konsole output

cat /proc/asound/cards

Konsole output
2 [Loopback]: Loopback - Loopback
Loopback 1
73 ... Sid.

From: Mike
Topic: 1440 Message: 1450

after

cp /proc/config.gz .

should i

cd /proc/ ?

1452. Re: [n2adr-sdr] quisk Fldigi and Odroid

Yahoo group: n2adr-sdr
Date: 2015-06-03 21:06:58 UTC
From: Sid Boyce
Topic: 1440 Message: 1452

No,
you are just copying /proc/config.gz to the current directory
linux-3.8.13.301
"gzip -d config .gz" results in the file config which you then rename
.config.

That ensures the kernel config is the same as used with the running
3.8.13.30 kernel.
Then you edit .config and change the line to CONFIG_SND_ALOOP=m so it's
built as a module
73 ... Sid.

1453. Re: [n2adr-sdr] quisk Fldigi and Odroid

Yahoo group: n2adr-sdr
Date: 2015-06-03 23:01:11 UTC
From: Sid Boyce
Topic: 1440 Message: 1453

Great to hear it's up.

Building and installing kernels on ODROID is a bit more involved than on
x86_64. On x86_64 it only needs installing the .deb packages.
73 ... Sid.

1454. add feature

Yahoo group: n2adr-sdr
Date: 2015-06-22 05:46:38 UTC
From: Mike
Topic: 1454 Message: 1454

guess this isn't really a feature ....

id like the digital button .. also have a FM too .... besides the USB/LSB/IQ

My SDR covers 2M and id like to send the Rx'd audio to the aloop ....

--
Mike KC7NOA

1455. freedv

Yahoo group: n2adr-sdr
Date: 2015-06-23 00:37:18 UTC
From: Mike
Topic: 1455 Message: 1455
Attachments: 1 described; binary payloads are missing from this source WARC

I downloaded freedv2 and installed .....

freedv is getting audio from quisk -- using the DGT-U button, the FDV-U button is still greyed out ...

freedv cant seem to use the PTT control that quisk/fldigi ... that type of control isn't in freedv list.
maybe it doesnt really need it ...

-- Mike KC7NOA

1456. freedv

Yahoo group: n2adr-sdr
Date: 2015-06-23 20:20:13 UTC
From: Mike
Topic: 1455 Message: 1456

```
im getting an location error when python setup.py thats in the freedvpkg
folder is ran ....

about no folder freedv in folder freedvpkg ...

odroid@odroid:~/Downloads/quisk/freedvpkg$ sudo python setup.py install
running install
running build
running build_py
running build_ext
running build_scripts
error: file '/home/odroid/Downloads/quisk/freedvpkg/freedv' does not exist

im not sure what is trying to call that yet ....

--
Mike KC7NOA

1457. Fwd: freedv

Yahoo group: n2adr-sdr
Date: 2015-06-23 21:16:07 UTC
From: Mike
Topic: 1457 Message: 1457
Attachments: 2 described; binary payloads are missing from this source WARC

ok .. so i did get freedv working from a svn download ... called fdmdv2

it was installed at /usr/local/bin$

so i cd over there and

cp freedv /home/odroid/Downloads/quisk/freedvpkg/

or simply put, copy'd the freedv over into the freedvpkg folder ....

so a few things missing from the readme instructions ... or they are
just too simple ....

to get freedv button in quisk to work ... you need to run the setup.py
that's in the freedvpkg folder, not the one in the quisk folder ...

1460. freedv useage

Yahoo group: n2adr-sdr
Date: 2015-06-23 23:49:52 UTC
From: Mike
Topic: 1460 Message: 1460

Is there a way to use the freedv button .. and still have the freedv window too ....??

im not sure where the center mark is ... and i seem to remember that you can change where the center marker is in freedv

1463. freedv added another mode 700

Yahoo group: n2adr-sdr
Date: 2015-06-24 18:25:53 UTC
From: Mike
Topic: 1463 Message: 1463

I see that freedv added another mode ... 700

does the build code for quisk need to be updated to use that or ....
just rebuild freedv and quisk will reflect the newer 700 ?

1464. Re: [n2adr-sdr] Fwd: freedv

Yahoo group: n2adr-sdr
Date: 2015-06-25 19:44:51 UTC
From: Mike
Topic: 1457 Message: 1464

I think its working ... i could decode the voice of AC7TY, he is over by
Seattle and im in Spokane Wa .... he couldnt decode me .. he said that
he could see my signal, just not decode .... not sure if he needed to
move the center marker on his side or what .. but i would like to be
able to see the freedv window when that mode is enabled ...

Hope that the "700" mode is soon released as stable ...

1466. freedv and Quisk

Yahoo group: n2adr-sdr
Date: 2015-06-26 19:57:43 UTC
From: Mike
Topic: 1466 Message: 1466

How does freedv get added to qusik ...

Iv build the freedv-dev and it does run with terminal command of "freedv"

but im not sure how to get the setup.py in the quisk folder to add freedv ... (or is it the setup.py in the freedvpkg folder that does that part)

quisk-3.6.22/freedvpkg/README.txt
Konsole output
Under sub-heading: Subdirectory codec2
"make" builds freedv.so

Konsole output
sdrbox:/opt/quisk-3.6.22 #python setup.py install

sdrbox:/opt/quisk-3.6.22 #python quisk.py

I find executing "quisk" from the command line causes FDV-U to come up
greyed out.

From: Mike
Topic: 1466 Message: 1468

I dont understand ...

If quisk has not been built to use freedv ... how does building freedv change/add the freedv button (and modes -- 700, 1200,1400 & 1600) to quisk?

Does freedv.so need to be in the quisk folder or the freedvpkg folder ...

Should quisk have a "make" done in quisk folder before "python setup.py install"?

****

why is there a setup.py in the freedvpkg folder ? -- it looks like it installs freedv as a regular program that can be ran ... i cant tell if its doing anything with quisk

1469. Re: [n2adr-sdr] freedv and Quisk

Yahoo group: n2adr-sdr
Date: 2015-06-26 23:26:45 UTC
From: Sid Boyce
Topic: 1466 Message: 1469

"make" with the makefile in quisk-3.6.22 executes:-
Konsole output
python setup.py build_ext --force --inplace

Right clicking on FDV-U changes to FDV-L and the only bandwidths
selectable are 1600 and 1200.

I'll have a play with the HiQSDR tomorrow to gain better insights. It's
possible that there is leftovers from previous installs are causing
command line quisk not to enable FDV.

freedv have selections for 1400 v0.91, 1600 and 1600 Wide while Jim's
README.txt states 1200.
I leave freedv.so in the freedvpkg directory.

I've also discovered that "python setup.py install" doesn't move the
hiqsdr directory to /usr/local/lib/python2.7/site-packages/quisk/ but
even then FDV is greyed out when the quisk is directory is copied across
manually and only
"python quisk.py" results in it not greyed out.

Don't know how it works for softrock.
73 ... Sid.

yea .. the reason you have only 1200 and 1600 is because you didn't
build the -dev of freedv ...

Id like to try out the newer (not stable - beta) 700 bandwidth ...

Im not sure how the bandwidth buttons in qusik more FDV-U/FDU-L are
coded ....

I had hoped that they were queried from freedv by quisk .. but so far
all i have is buttons for 1200 1600 and 1000 ... not 700 ...

sooooo .. hummmm ...?????

On a side note .. i need to look into fixing the spacing of quisk's
buttons ... my screen size is not being calc'd right or something ....

i meant time / file/

ok i forgot what they were again .. you can see what i mean ...

BTY .. does that slider change the bandwidth of freedv ?

Sid .. do you see the same bandwidth buttons that i do ?

1473. Re: [n2adr-sdr] freedv and Quisk

Yahoo group: n2adr-sdr
Date: 2015-06-27 13:57:20 UTC
From: Sid Boyce
Topic: 1466 Message: 1473

Now I have 700 and 1600 with fdmdv2-dev

quisk uses the module freedv.so that is built from the freedv.c included.

In freedvpkg/setup.py
Konsole output
```
from distutils.core import setup, Extension
import sys

moduleLinux = Extension ('freedv',
libraries = ['m', 'codec2'],
sources = ['../import_quisk_api.c', 'freedv.c'],
include_dirs = ['.', '..', './codec2/src'],
library_dirs = ['./codec2/build_linux/src'],
runtime_library_dirs = ['freedvpkg/codec2/build_linux/src'],
)
```

The standalone freedv binary may work with any rig that hamlib knows,
quisk doesn't rely on it.
73 ... Sid.

From: Sid Boyce
Topic: 1466 Message: 1475

quisk-3.6.22/freedvpkg/freedv.so stays exactly where it is built and
quisk uses it.

quisk is built with codec2/codec2-dev which has fdmdv source files in
quisk-3.6.22/freedvpkg/codec2/src/.

freedv built from fdmdv2-dev source is not used by quisk.
73 ... Sid.

1477. Re: [n2adr-sdr] freedv and Quisk

Yahoo group: n2adr-sdr
Date: 2015-06-30 22:56:08 UTC
From: Sid Boyce
Topic: 1466 Message: 1477

It only changes from FDV-U to FDV-L.

Jim has only produced a module (freedv.so) for quisk from
codec2/codec2-dev.

fdmdv2 and the freedv binary it builds doesn't figure in quisk or
ghpsdr3-alex.
73 ... Sid.

1478. Re: [n2adr-sdr] freedv and Quisk

Yahoo group: n2adr-sdr
Date: 2015-06-30 23:37:43 UTC
From: Mike
Topic: 1466 Message: 1478

whats the reason for setup.py in freedvpkg folder to

mike@SDR-client:~/Downloads/quisk-3.6.22/freedvpkg$ python setup.py install
running install
running build
running build_py
running build_ext
running build_scripts
running install_lib
running install_scripts
changing mode of /usr/local/bin/freedv to 755 <------ what is this
line doing?-- im not sure what 755 is

update of sorts .... running "make" in freedvpkg is the way that
freedv.so is built ....

Im getting closer ..

1479. Re: [n2adr-sdr] freedv and Quisk

Yahoo group: n2adr-sdr
Date: 2015-07-01 20:39:54 UTC
From: Sid Boyce
Topic: 1466 Message: 1479

755 is file permissions rwxr-xr-x user - read/write/execute, group - read/execute, other - read/execute.

Forget /usr/local/bin/freedv that is built and installed from fdmdv2 as it has nothing to do with quisk and is not mentioned anywhere.

We have been running ghpsdr3-alex for the longest time using codec2/codec2-dev again with no referenced to fdmdv2.

fdmdv2 produces the binary "freedv" which uses hamlib and looks like a standalone application that will run any hamlib supported rig from the pull-down list.
If you have hamlib installed -----
Konsole output
slipstream:/usr/src/XXX/quisk-3.6.22 #rigctl -l|grep -i si570
2509 SoftRock Si570AVR-USB 0.2 Beta
2511 KTH-SDR kit Si570PIC-USB 0.2 Beta
2516 AE9RB Si570Peaberry V1 0.2 Beta
2517 AE9RB Si570Peaberry V2 0.2 Beta
73 ... Sid.

1481. Re: [n2adr-sdr] freedv and Quisk

Yahoo group: n2adr-sdr
Date: 2015-07-01 21:19:51 UTC
From: <Patriot121@...>
Topic: 1466 Message: 1481

Ok .... iv been trying to get 700 into Quisk the wrong way .....

Which files in the original codec2 folder need to stay when codec2-dev is moved into freedvpkg/codec2 ?

Sent by Outlook for Android

1482. Re: [n2adr-sdr] freedv and Quisk

Yahoo group: n2adr-sdr
Date: 2015-07-01 22:16:23 UTC
From: Sid Boyce
Topic: 1466 Message: 1482

exploding quisk-3.6.22 the freedvpkg/codec2 contains all the files needed.
A short while ago I did that and built freedv.so and quisk for x86_64 as
freedv.so, _quisk.so and library in freedvpkg/codec2/build_linux/src/ in
the quisk-3.6.22.tar.gz file from Jim are all 32-bit x86.
Konsole output
slipstream:/usr/src/YYY/quisk-3.6.22/freedvpkg #ls -l
codec2/build_linux/src/
total 504
drwxrwxr-x 2 lancelot vboxusers 4096 Apr 29 20:22 ./
drwxrwxr-x 3 lancelot vboxusers 4096 Apr 29 20:22 ../
lrwxrwxrwx 1 lancelot vboxusers 16 Apr 15 14:56 libcodec2.so->
libcodec2.so.0.3*
-rwxrwxr-x 1 lancelot vboxusers 504804 Apr 15 14:56 libcodec2.so.0.3*
slipstream:/usr/src/YYY/quisk-3.6.22/freedvpkg #file
codec2/build_linux/src/libcodec2.so.0.3
codec2/build_linux/src/libcodec2.so.0.3: ELF 32-bit LSB shared object,
Intel 80386, version 1 (SYSV), dynamically linked,
BuildID[sha1]=498863ced7d6f36f2c54274879c0c4ade09b18e0, not stripped

I ran make in the freedvpkg directory to build the 64-bit freedv.so
Konsole output
slipstream:/usr/src/YYY/quisk-3.6.22/freedvpkg #file freedv.so
freedv.so: ELF 64-bit LSB shared object, x86-64, version 1 (SYSV),
dynamically linked,
BuildID[sha1]=3ef058b592b8582e21806cf72dcbd4cdafcb401a, not stripped

Then I ran make in quisk-3.6.22 to build a 64-bit _quisk.so which
overwrote Jim's 32-bit _quisk.so
Konsole output
slipstream:/usr/src/YYY/quisk-3.6.22 #file _quisk.so
_quisk.so: ELF 64-bit LSB shared object, x86-64, version 1 (SYSV),
dynamically linked,
BuildID[sha1]=a964c22ec969cc98fc7a58979209915b31c86892, not stripped

If you want to replace them with the latest codec2-dev you can remove of
move the codec2 directory and either move or copy the codec2-dev
directory into quisk-3.6.22/freedvpkg and rename it codec2.

Run make in freedvpkg to make freedv.so and run make in quisk-3.6.22 to
make _quisk.so, then either "python setup.py install" or "make install".

Konsole output
root@odroidu3:/opt/quisk-3.6.22/freedvpkg# file freedv.so
freedv.so: ELF 32-bit LSB shared object, ARM, EABI5 version 1 (SYSV),
dynamically linked,
BuildID[sha1]=d0245f3e288ff324675d6bd81fee85eea040d739, not stripped

Konsole output
root@odroidu3:/opt/quisk-3.6.22# file _quisk.so
_quisk.so: ELF 32-bit LSB shared object, ARM, EABI5 version 1 (SYSV),
dynamically linked,
BuildID[sha1]=e1cde3590ee06062b6b500b5e7d75a4b13c2ffbd, not stripped

fdmdv2
=========
freedv knows about hamlib. I don't have hamlib installed so no rigctl
from hamlib on the ODROID-U3 but I do have wsjtx installed, may be it's
finding the rig using rigctl-wsjtx.

Konsole output
root@odroidu3:~# rigctl-wsjtx -l | grep Si570
2509 SoftRock Si570AVR-USB 0.2 Beta
2511 KTH-SDR kit Si570PIC-USB 0.2 Beta
2516 AE9RB Si570Peaberry V1 0.2 Beta
2517 AE9RB Si570Peaberry V2 0.2 Beta

1483. Re: [n2adr-sdr] freedv and Quisk

Yahoo group: n2adr-sdr
Date: 2015-07-01 22:42:56 UTC
From: Mike
Topic: 1466 Message: 1483

```
im getting an error when i use the codec2-dev .....

mike@SDR-client:~/Downloads/quisk-3.6.22/freedvpkg$ sudo make
python setup.py build_ext --force --inplace
running build_ext
building 'freedv' extension
x86_64-linux-gnu-gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv
-O2 -Wall -Wstrict-prototypes -fPIC -I. -I.. -I./codec2/src
-I/usr/include/python2.7 -c ../import_quisk_api.c -o
build/temp.linux-x86_64-2.7/../import_quisk_api.o
x86_64-linux-gnu-gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv
-O2 -Wall -Wstrict-prototypes -fPIC -I. -I.. -I./codec2/src
-I/usr/include/python2.7 -c freedv.c -o build/temp.linux-x86_64-2.7/freedv.o
freedv.c:7:24: fatal error: freedv_api.h: No such file or directory
#include "freedv_api.h"
^
compilation terminated.
error: command 'x86_64-linux-gnu-gcc' failed with exit status 1
make: *** [all] Error 1
mike@SDR-client:~/Downloads/quisk-3.6.22/freedvpkg$

i might have a bad build of codec2-dev .. need to check , but its
complaining of a missing file .... freeedv_api.h that was in the
original codec2 folder

1484. Re: [n2adr-sdr] freedv and Quisk

Yahoo group: n2adr-sdr
Date: 2015-07-01 23:03:02 UTC
From: Mike
Topic: 1466 Message: 1484

when i try to make in quisk folder , build complains about missing files ...

freedv_api.h and varicode.h that are saposed to be in src .... they are
not in the recent stable of codec2 (from svn co
https://svn.code.sf.net/p/freetel/code/codec2 codec2)

when i bring these files into the recent (less than an hour old) codec
stable from an older download of quisk.22 that Jim provided it will
build ...

do i need to get a new quisk download .... for these files to not be
needed ....? (because of a new makefile ?)

On 07/01/2015 03:16 PM, Sid Boyce g3vbv@... [n2adr-sdr] wrote:

1485. Re: [n2adr-sdr] freedv and Quisk

Yahoo group: n2adr-sdr
Date: 2015-07-02 00:55:03 UTC
From: Sid Boyce
Topic: 1466 Message: 1485

The files are in codec2-dev only.
The latest Rev: 2232 fails to build, they did say that codec2-dev may or may not build or work - first time this has happened.
Konsole output

Konsole output ^
freedv.c: In function ?get_snr?:
freedv.c:159:48: error: ?struct freedv? has no member named ?fdmdv_stats?
return PyFloat_FromDouble(quisk_freedv_handle->fdmdv_stats.snr_est);
^
freedv.c:162:1: warning: control reaches end of non-void function
[-Wreturn-type]
}
^
error: command 'gcc' failed with exit status 1
make: *** [all] Error 1

Konsole output
Earlier revs work - Konsole output
Rev: 2137 which I have around works and also Jim's which is obviously from an earlier rev.

The latest codec2-dev is missing fdmdv_stats from src/fdmdv.c, either in error or deliberately because the code has changed since yesterday and freedvpkg/freedv.c does not reflect the change.
fdmdv_stats is now only in stm32/src/ files.
73 ... Sid.

1486. Re: [n2adr-sdr] freedv and Quisk

Yahoo group: n2adr-sdr
Date: 2015-07-02 02:12:58 UTC
From: Mike
Topic: 1466 Message: 1486

ok .. so that just not me ,... i get the same error with codec2-dev....
how do you pull older versions with svn ?...

its been longer than yesterday .. from monday i think , or last saturday ...

On 07/01/2015 05:55 PM, Sid Boyce g3vbv@... [n2adr-sdr] wrote:

1487. Re: [n2adr-sdr] freedv and Quisk

Yahoo group: n2adr-sdr
Date: 2015-07-02 20:50:42 UTC
From: Sid Boyce
Topic: 1466 Message: 1487

The last compatible versions is Rev 2134
Konsole output
"svn co https://svn.code.sf.net/p/freetel/code/codec2-dev -r2134"
src/fdmdv.c was changed in Rev 2147.
73 ... Sid.

ok .. i still get this error too ..

even though i do have the latest speex installed from apt-get ...

```
-- Looking for pthread_create in pthread - found
-- Found Threads: TRUE
-- Threads library flags: -lpthread
-- Looking for Speex DSP library.
-- Speex DSP headers: /usr/include
-- Speex DSP library: SPEEXDSP_LIBRARY-NOTFOUND
CMake Error: The following variables are used in this project, but they
are set to NOTFOUND.
Please set them or make sure they are set and tested correctly in the
CMake files:
SPEEXDSP_LIBRARY
linked by target "speexnoisesup" in directory
/home/mike/Downloads/codec2-devinstall/unittest

-- Configuring incomplete, errors occurred!
```

ill cmake with out tests ...

From: Sid Boyce
Topic: 1466 Message: 1489

Typing make in freedvpkg I got no errors.
On ODROID-U3 I also get no problems which has -r2142.

Konsole output
Last Changed Rev: 2142
Last Changed Date: 2015-05-20 23:50:58 +0100 (mi?, 20 may 2015)

These are the speex packages installed on ODROID-U3.

Konsole output
i libspeex1
- The Speex codec runtime library
i libspeexdsp-dev
- The Speex extended library development files
i libspeexdsp1
- The Speex extended runtime library
73 ... Sid.

1491. quisk screen issues with freedv

Yahoo group: n2adr-sdr
Date: 2015-07-02 23:55:43 UTC
From: Mike
Topic: 1491 Message: 1491

ok .. so im looking for some help to fix my full screen issues ....

in the two screen shots ... both are the same running quisk ... one is elongated to see the rest of the buttons ....

can anyone point me to a way to make the button test smaller or make buttons "time","test1" and file(play) smaller ?

From: Sid Boyce
Topic: 1491 Message: 1493

Size of screen and resolution?

I am having the same problem with the -C1 and 7" touchscreen (720x480 @ 32bpp) with SDR apps - quisk, rasdr and openHPSDRJ.

I have been searching for a fix for a few days.

On the HiQSDR I am running rasdr on a Raspberry Pi model B with a 7" touchscreen without the problem.
Konsole output
root@raspberrypi:~# fbset

mode "800x480"
geometry 800 480 800 480 16
timings 0 0 0 0 0 0 0
rgba 5/11,6/5,5/0,0/16
endmode

Konsole output
root@odroid-c1:~# fbset

mode "720x480"
geometry 720 480 720 960 32
timings 0 0 0 0 0 0 0
rgba 8/16,8/8,8/0,8/24
endmode

I have been trying fbset with different geometries from /etc/fbmodes but I end up with a scrambled screen.
73 ... Sid.

Sid .... try

button_font_size= 8 #or 7, think default is 10

In the .quisk_conf.py file .... I'll try when I get some time

<n2adr-sdr@yahoogroups.com> wrote:
Size of screen and resolution?

I am having the same problem with the -C1 and 7" touchscreen (720x480 @
32bpp) with SDR apps - quisk, rasdr and openHPSDRJ.

I have been searching for a fix for a few days.

On the HiQSDR I am running rasdr on a Raspberry Pi model B with a 7"
touchscreen without the problem.
Konsole output
root@raspberrypi:~# fbset

mode "800x480"
geometry 800 480 800 480 16
timings 0 0 0 0 0 0 0
rgba 5/11,6/5,5/0,0/16
endmode

Konsole output
root@odroid-c1:~# fbset

mode "720x480"
geometry 720 480 720 960 32
timings 0 0 0 0 0 0 0
rgba 8/16,8/8,8/0,8/24
endmode

I have been trying fbset with different geometries from /etc/fbmodes but
I end up with a scrambled screen.

ok Sid,

button_font_size= 8

seems about the best for me ..... see screen shot

If anyone else is wondering ... we are using usb based displays on Arm7
....

Im using a iMo (DisplayLink chipset) ... 7" touchpannel, dont rememebr
what Sid is using ....

anyways .. getting better all the time ....

From: Sid Boyce
Topic: 1491 Message: 1496

All my 7" displays are HDMI with USB touch.

The same application running on the Raspberry Pi gives perfect display
at 800x480 16bpp whilst on the ODROID-C1 it's too large at 720x480 32bpp.

I am looking for a resolution that will work, so far both fbset and
xrandr using options from /etc/fb.modes have given me a completely
scrambled screen as though it's failed to sync.

When it boots up lxterminal and any other normal application is OK.
73 ... Sid.

1497. latest freedv into quisk

Yahoo group: n2adr-sdr
Date: 2015-07-06 03:25:03 UTC
From: Mike
Topic: 1497 Message: 1497

I tried to incoperate the latest freedv into quisk ...

I did a stand alone build of freedv(fdmdv2-dev) that did build and run ....

I renamed the original freedvpkg to freedvKeep and moved fdmdv2-dev
into quisk foler ..

then renamed fdmdv2-dev to freedvpkg ....

then from the freedvkeep folder copied into folder freedvpkg(fdmdv2-dev)

freedv.c
freedv.pyd
init.py
init.pyc
makefile
setup.py

then from freedvpkg(fdmdv2-dev)/codec2/build-linux/codec2-prefix/src/
copied codec2 to folder freedvpkg

then in terminal freedvpkg ran make .. getting error

```
mike@SDR-client:~/Downloads/quisk-3.6.22/freedvpkg$ make
python setup.py build_ext --force --inplace
running build_ext
building 'freedv' extension
x86_64-linux-gnu-gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv
-O2 -Wall -Wstrict-prototypes -fPIC -I. -I.. -I./codec2/src
-I/usr/include/python2.7 -c ../import_quisk_api.c -o
build/temp.linux-x86_64-2.7/../import_quisk_api.o
x86_64-linux-gnu-gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv
-O2 -Wall -Wstrict-prototypes -fPIC -I. -I.. -I./codec2/src
-I/usr/include/python2.7 -c freedv.c -o build/temp.linux-x86_64-2.7/freedv.o
In file included from freedv.c:7:0:
freedv_api.h:44:26: error: field ‘fdmdv_stats’ has incomplete type
struct FDMDV_STATS fdmdv_stats;
^
freedv.c: In function ‘get_snr’:
freedv.c:162:1: warning: control reaches end of non-void function
[-Wreturn-type]
}
^
error: command 'x86_64-linux-gnu-gcc' failed with exit status 1
make: *** [all] Error 1
mike@SDR-client:~/Downloads/quisk-3.6.22/freedvpkg$
```

OK .. now i assume that Jim wrote the freedv.c that's in folder freedvpkg ....

Im wondering what changes need to be done to get the latest freedv aka (fdmdv2-dev) to build into quisk ....

I think this process did work with previous versions of freedv ... as seen with my screen capture with 700 as one of the choices for FDV-U (i think i also copyed libcodec2.so from installed area of standalone codec2 - but i guess ill get to that later)

Hope every one doing well .... Mike

From: Sid Boyce
Topic: 1497 Message: 1498

fdmdv2-dev and codec2-dev are not the same, the number of files and
filenames in their src directories are completely different.

Of course fdmdv2-dev would build and work as it's function is to build
the standalone freedv app.

Jim's freedv.c depends on codec2-dev and the latest rev. 2234 is not
compatible with it because
codec2-dev/src/fdmdv.c has been changed upstream.

The latest codec2-dev I have tested that works is rev. 2142. I haven't
checked any later versions other than r2208 which is also incompatible --
see "svn log | less" for all changes.

Almost certainly latest versions of codec2-dev and fdmdv2-dev would work
with quisk as only the header files are used but it would require
rewrites of freedv.c. for either or both.

Did yo guys get your screen resolution sorted out? The parameter I use on my netbook to scale the spectrum to fit the Quisk window is ...

```
# The width of the graph data as a fraction of the total screen size. This
# will be adjusted by Quisk to accommodate preferred FFT sizes. It can
# not be changed once Quisk starts. It can not be made too small because
# of the space needed for all the buttons.
graph_width = 0.65
```

I got a solution from Mike Durkin.
In my case, on a 7" touch screen I had to add a line to ~/.quisk_conf.py.
Konsole output
button_font_size= 5

My screen resolution is 800x480@60 Hz on the ODROID-C1. Buttons are a
bit small but "readable". At size =6 quisk Y and Z sliders appear behind
the right most buttons.

On the standalone HiQSDR rasdr on the Raspberry Pi model B + another 7"
touch screen is crystal clear but on the ODROID-C1 rasdr is massive at
the same 800x480 (advertised spec) compared to what it was at 720x480
but in both cases the waterfall disappears below and is not scrollable.

I'll have a play with graph_width in quisk.
73 ... Sid.

1502. Quisk 3.7.0 July 2015

Yahoo group: n2adr-sdr
Date: 2015-07-11 14:56:56 UTC
From: jahlstr@...
Topic: 1502 Message: 1502

Quisk now supports a new radio, the HermesLite. If you have a HermesLite, copy hermes/quisk_conf.py to your config file and modify the copy. You should only need to change the soundcard names. If you use Quisk on multiple radios, remember that you can have multiple config files. Use "python quisk.py -c my_config_file.py" or its equivalent to choose among config files. This code is currently under test and may have problems.

The favorites screen now has two more columns for repeater offset and CTCSS tone. See the file quisk_conf_defaults.py. You must set do_repeater_offset=True, and your hardware must be capable of performing the shift.

The FDV feature is now in "final" form. Please see freedvpkg/README.txt. Note that FDV is a moving target.

There is now an option to send radio sound to a UDP device. This is used to send radio sound to SDR hardware that has a built-in codec. See quisk_conf_defaults.py.

The SoftRock hardware file now supports the key line as a PTT button for voice modes. Use this if you have a hardware mic button that you can connect to the key line.

I added the sidetone volume to the HiQSDR control data to accommodate new hardware. I softened the volume controls Vol and Sto for a smoother response. I added the new config file option cw_delay.

Jim

I use a UHFSDR, and its quite capable of doing a harware shift of 100Mhz
..... ie change the Si570 to the new frequency and then back ....

im not sure i understand this line in the quisk_conf_defaults.py

Your hardware file must define the method _*RepeaterOffset(self,
offset=None)*_.
do_repeater_offset = False

I have added the line

do_repeater_offset = True

to my /home/.quisk_conf.py file

My UHFSDR uses a Si570 is similar to the Ensemble .... but uses a divide
by 2 rather than a divide by 4 for quadrature ...

Firmware version of the AVR is 15.14 (QRP2000)

The RepeaterOffset() is a method (function) that is in the hardware file. I wrote this function for the HiQSDR, but I can not write it for hardware I do not have, such as the UHFSDR. You need to write this yourself, or find a copy on the internet.

I do believe that you already have compatible hardware ....

Sid Boyce G3VBV, sent you a Ensemble RXTX ready built .... its
essentially the same as a UHFSDR as far as Si570 control is concerned.

The standard 10-meter repeater offset is -100 kHz .... well out side of
most soundcards response range and a hardware frequency change would be
needed to use a 10M repeater.

  Quisk now supports a new radio, the HermesLite. If you have a HermesLite, copy hermes/quisk_conf.py to your config file and modify the copy. You should only need to change the soundcard names. If you use Quisk on multiple radios, remember that you can have multiple config files. Use "python quisk.py -c my_config_file.py" or its equivalent to choose among config files. This code is currently under test and may have problems.
The favorites screen now has two more columns for repeater offset and CTCSS tone. See the file quisk_conf_defaults.py. You must set do_repeater_offset=True, and your hardware must be capable of performing the shift.
The FDV feature is now in "final" form. Please see freedvpkg/README.txt. Note that FDV is a moving target.
There is now an option to send radio sound to a UDP device. This is used to send radio sound to SDR hardware that has a built-in codec. See quisk_conf_defaults.py.
The SoftRock hardware file now supports the key line as a PTT button for voice modes. Use this if you have a hardware mic button that you can connect to the key line.
I added the sidetone volume to the HiQSDR control data to accommodate new hardware. I softened the volume controls Vol and Sto for a smoother response. I added the new config file option cw_delay.

When installing on Windows using the MSI file, Quisk installs as a package. It is in the Python library directory under site-packages/quisk. On my machine that is C:/python27/Lib/site-packages/quisk. Then look in the hermes subdirectory.

Quisk installs itself as a package so it can be used by other programs such as panadapters. But if this is inconvenient, you can use the source distribution, the *.tar.gz file, and install anywhere you want. Then the files are easier to find.

Oh, the UHFSDR uses Si570 USB control too.

In that case the hardware frequency shift may be a problem. The Si570 can change frequencies fast only for "small" changes. For "large" changes it may need to change the PLL range. It would be necessary to sense when the frequency change was complete, and suppress Tx until that time. I will work on this, but I wouldn't mind if someone could help.

There were some problems with 3.7.0. Use the new 3.7.1.instead, and check the file CHANGELOG.txt.

make a tx delay and rx delay adjustable for Si570 to reach its freq ......

the china beofeng has a change over delay of almost half second ---- and
people seem to love that piece of poop.

id guess 100ms is an ok place to start ...

i dont think how large past the large jump in freq is ... im sure that
it will be of little time difference ....
1Mhz or 20Mhz jumps should be the same time for lock to be reached ....

i can only judge from listening. i don't have equipment to measure that ....

From: runeegil@...
Topic: 1512 Message: 1512
Attachments: 1 described; binary payloads are missing from this source WARC

Hi All,

I try to get DXcluster to run with quisk, however i get an error when open quisk.

My question is:

quisk / HIQSDR is running on 192.168.2.196

My WIFI is running on 192.168.1.XXX do i need to change IP to be in the same subnet ?.

see attachment

Hi Rune long time since we contacted. Back in the old SDRShell days :-)

There are a couple of methods you can use. Here I leave the HIQSDR running on 192.168.2.196 and as I am using a fixed IP address on each computer in my house I change the Netmask to 255.255.252.0 which will allow you to access on subnet 2. It is easyish to change the HiQSDR and probably you should do that in the end but the netmask is an instant fix.

Hi Graeme

Thanks for quick reply. Yes my softrock and Mobo is still running and all in a cabinet :-)
Now i just got my HIQSDR online after two years in the box. I will try the Netmask but as you mentioned the best is to change the IP on HIQSDR. Not sure how i should do that but i guess its written somewhere.
I am running DL2STG latest firmware xxxxsg-9.

OK, bed time here now and i will continue tomorrow.

Yahoo group: n2adr-sdr
Date: 2015-07-24 17:16:51 UTC
From: jahlstr@...
Topic: 1519 Message: 1519

I made some changes for Hermes-Lite. You must add rx_udp_clock to your config file. You can adjust rx_udp_clock slightly to correct the frequency display. See hermes/quisk_conf.py. I added Hermes_BandDict to the config file. It controls the bits on the J16 connector of the Hermes-Lite.

Quisk will now keep the same filter for a given mode when changing bands. I added RepeaterOffset() to the softrock hardware file so that repeater offsets work. I added mode DGT-FM for digital FM modes.

Topic: 1519 Message: 1524

Hi Jim,

Yet again thanks for all the work you are putting into Quisk. My Hermes-Lite is unavailable at present due to mods (ongoing process) but the HiQSDR is working just fine with 3.7.2.

I was inspired to set up a startup menu with the new release and using your startup.py as a model I changed it to match my hardware. I got it to go OK but thought I would mention a couple of things about the list box.

To avoid the bottom choice being partly obscured I needed to add a blank line e.g.
(' HermesLite', 'zl2apv/quisk_conf_HL.py', ''),
('','',''),
]

The first choice in the list is highlighted but not selected so a return won't implement the selection, nor will arrow keys step down from it until it has been clicked to select.

I could be way off target here as this is only my second look into a Python program although it seemed pretty intuitive after I figured out that white space and indenting were there for more than pretty code.

tnx es 73, Graeme zl2apv

Tried to use the new version ... im getting a syntax error in
hardware_usb.py ... that might be my fault ...

also that when i tried to reconfigure in quisk folder .... i usally
always need to do that because im running Arm7 and not an intel based
puter .... anyways i get version failure with autoreconf complaining
that my 2.1 version is too old and it wants 2.8 and 2.9

Im just going by memory at teh moment .. i just got done working on our
(ok Wife's car) fo almost 2 days (man Toyota's way to water pump/serp
belt is sill) and i tried the new version while the oil was draining...

what else there to use for reconfiguring ?

sourceforge is working for autoreconf but shows version 0.0.0.1 as
latest ... that ain't right ...

Hi Jim et al,

Got my Hermes-Lite back together and finished testing. Everything went as advertised. The filter holding its settings through the bands is something I was going to ask for and is a great help. Both HiQSDR and Hermes running perfectly and selectable through your startup app.

Mike I wish I could be of some use to you but only just got my arm machine so no experience yet. Guess you will have to wait for Sid.

Hi,

You are the first to mention startup.py!

On my machine, I need to select a line with the mouse, and then up/down keys work.

My Hermes-Lite is not working either. Somehow, DHCP stopped working.

The syntax error is a bug. Download 3.7.2 again and it should work.

I don't know about this. Quisk only uses "make", and has no configure file.

Does DHCP work with the Hermes board unplugged? Steve has a test mode which detects no HL present. If related to HL board then I guess the magnifying glass is your friend. Good luck.

Graeme

I didint use the freedv that came with 3.7.2 .... i trashed it and
copied my 3.7.1 that worked with bootstraped stuff ....

im getting an version issue with autoreconf and this syntax error....

1535. Spot tuning from Quisk

Yahoo group: n2adr-sdr
Date: 2015-07-25 18:14:35 UTC
From: gvjury@...
Topic: 1535 Message: 1535

Hello Group,

On another list I asked Jim if he would code the "Spot" button so that it keyed the Tx immediately when clicked and of course un-keyed when clicked again rather than having to additionally click the ptt as at present.

Jim agreed to consider it but was somewhat reluctant which I am certain will be out of consideration for how his users will have developed their operating practice and may not like the change and partly because he likes it as it is. Anyway I am posting here to give you the opportunity to agree or object or silently state that either way is OK. In my case the tune button on my Kenwood ts-50 turns on my Tx at reduced power and activates my home brew auto-tuner. It does un-key the ts-50 when tuning complete and that would be a nice feature for Quisk/HiQSDR too but let's not get into that yet. I would like Quisk to behave in the same fashion with the spot tune.

BTW Jim will look some time (if he ever gets any) at having the spot button work for CW mode also. At present we either use the ptt button in Quisk or straight key the hardware which means tuning at full power or switching off the linear and tuning with the exciter output. There is a downside to setting the power level from the spot button where if your final is switched by detecting the presence of RF there may be insufficient to key it and you may find that your tune power is suddenly down to half a watt or so and not enough for a tune up.

1536. Re: [n2adr-sdr] Quisk 3.7.2

Yahoo group: n2adr-sdr
Date: 2015-07-25 19:20:42 UTC
From: Sid Boyce
Topic: 1519 Message: 1536

autoreconf is not needed for configuring or building quisk - wrong tool.
No wonder it gives confusing errors.

I got no errors or problems on ODROID-U3 with the simple procedure outlined.

Jim's freedv.so and libcodec2 library are 32-bit x86 so freedv.so has to
be built for ARM. Removing libcodec2.so* and freedv.so from freedvpkg
forces freedv.so to be built using the ARM libcodec2.so.0.3 which should
have been installed for ghpsdr3-alex.

I go through exactly the same procedure to build and install quisk on
x86_64.
73 ... Sid.

It would be better to download and install everything. But if you want to copy files, the changed files are hermes/quisk_hardware.c, softrock/hardware_usb.py and quisk.py. So you need to copy quisk.py too.

ok .. i just went with the full download ... replaced freedvpkg with my older one ...

I have no errors now .... but duplex is not working .....

Im not sure if it is because i just use direct control of si570 rather declaring ensemble ....

I do have the line do_repeater_offset=True in my config file and

I tried +600 and just 600 for offset entry in the favorites.

From: runeegil@...
Topic: 1541 Message: 1541

Hi All,

How do I change the subnet / IP address on my HIQSDR. Today its 192.168.2.196, I want to change this to 192.168.1.196, currently using firmware
http://dl2stg.de/stefan/hiqsdr/files/fpga_ver3-sg9.tgz
http://dl2stg.de/stefan/hiqsdr/files/fpga_ver3-sg9.tgz from DL2STG. Would be nice to have the radio to "talk in the same subnet. Any suggestions please.

HI - I also used my old freedvpkg to make this release working.
I just intalled it on a Odroid-U3 and all is working except I have no curve on the screen (RX and TX work) - and I get an error from wxpython stdout/stderr :

"runtimeerror:failed to gain raw access to bitmap data"

As wxpython, I have downloaded from lubuntu center a package called "Pyragua" using wxpython...may be not the right one ?

Hi Rune,

with Firmware from Stefan, the only way to change the ip is to chang it in Firmware and flashe this to the HiQSDR because the IP is coded in Firmware.

Hi Pascal,
That's because the GL libraries implemented on the -U3 are from sunxi
and they don't properly replace the standard GL libraries.

This has been a long time problem.
They suggested I installed the standard Mesa libraries - trying that
wanted to remove tons of other standard packages.
I reported back and that was the end of the conversation - typical of
hardkernel.

Even in Ubuntu they still have the jack/pulseaudio problem hanging
around after years, something that was fixed in a few days on openSUSE
after I reported it.

This is how I run quisk on the -U3 and -C1 ....
Select WFall button and you will see a feint sign of the spectrum graph
above it and a dividing line between them, mouse over the line and a
double-headed arrow appears.
Grab it with left click and drag it down to lessen the waterfall height
and the spectrum graph height will increase.

You'll notice there is no waterfall activity.
73 ... Sid.

Hi Jim,
I am trying to get quisk to occupy 100% of the screen area of a 7"
touchscreen.

I am hoping to replace the Pi model B with the Pi 2 in my standalone
HiQSDR and run quisk in preference to rasdr.

I have changed quisk.py from "* 3 // 10" and reran make with no effect,
it still occupies 1/3 screen area.
Konsole output
self.height = application.screen_height* 10 // 10

I am beginning to regard hardkernel as a company that provides great
hardware and not much in the way of software support.

Many other ARM boards are using recent kernels whilst depending on the
ODROID board support is limited to one kernel, e.g ODROID-U3 is stuck at
kernel 3.8.13 and mainline is now up to 4.2.0-rc4 with some ARM boards
just a little behind.

There are files in the mainline kernel and the basic exynos_defconfig
along with dts files to support the individual boards.
I shall try building a -U3 4.2.0-rc4 kernel, earlier ones would boot but
X wouldn't start, suggesting a problem with Mali chip support.
Konsole output
sabre:/usr/src/linux-4.2.0-rc4/arch/arm/boot/dts #ls -l *odroid*
-rw-r--r-- 1 root root 11012 Jul 2 02:24 exynos4412-odroid-common.dtsi
-rw-r--r-- 1 root root 1371 Jun 14 01:26 exynos4412-odroidu3.dts
-rw-r--r-- 1 root root 1673 Jul 2 02:24 exynos4412-odroidx.dts
-rw-r--r-- 1 root root 956 Jun 14 01:26 exynos4412-odroidx2.dts
-rw-r--r-- 1 root root 10573 Jul 2 02:24 exynos5422-odroidxu3-common.dtsi
-rw-r--r-- 1 root root 599 Jul 2 02:24 exynos5422-odroidxu3-lite.dts
-rw-r--r-- 1 root root 1031 Jul 2 02:24 exynos5422-odroidxu3.dts

The ODROID forum was no help, linux-exynos list pointed me to the IRC
channel and none of the gurus there could supply a solution.

I'll check ArchLinux and Fedora 21 for ODROID to see if they do a better
job. openSUSE did a 12.3 version for ODROID-X but never went beyond
that, preferring to develop for the more popular boards like Pi/Pi2.

Hi Sid,

I think you changed the graph screen height. Try changing the main screen size at the call to QMainFrame().

If the height is wrong, can you drag the window border to make it bigger? Is the width OK?

Sid,
Their core business is based on Android, really the Odroid's are used by
app developers, as developing that stuff on a pc is a pain in the ass, not
to mention to use a real android device.

So, Linux is just few percent, hence the lesser support.

Thanks Andrea,
I now see why there is lots of Android stuff on their site.

I had been following the Linux forums which have always been quite
active so I expected them to come up with what looks like it should be a
simple solution.
Everything else but X works with the mainline kernels.

I don't see why the Mali support should be that different unless they
are using Mesa for Android and SunXi with Ubuntu for accelerated graphics.
73 ... Sid.

From: w4mmp@...
Topic: 1553 Message: 1553

Hi ,
Ok, stupid question time. What are the names of the variables in the .quisk_conf.py configuration file that are used for the rig audio devices. In other words:

Audio out from rig - variable name?
Audio in to rig - variable name?

I know the name of the hardware device (as reported by the portaudio pa_devs utility:

Peaberry SDR: USB Audio (hw:1,0)

Sorry, but I'm being "thick as brick" on this.

```
As an example:-
Konsole output
slipstream:/opt/quisk-3.7.2 #cat quisk_conf_peaberry.py
+ some lines I have added.
------------------------------------------------------------------------
from softrock import hardware_usb_new as quisk_hardware
from softrock import widgets_tx as quisk_widgets

si570_direct_control = True
si570_xtal_freq = 114211833

sample_rate = 48000
playback_rate = 48000
name_of_sound_capt = "hw:1,0" ## I-Q sound card connected to rig
name_of_sound_play = "plughw:0,0" ## on board codec for Mic/Speakers
microphone_name = "plughw:0,0" ## or is it "plughw:0,1"? I normally use
just "hw:0" and "hw:1".
name_of_mic_play = "hw:1"
channel_i = 0
channel_q = 1

usb_vendor_id = 0x16c0
usb_product_id = 0x05dc

Assumes the PCM3060 is sound card 0.

Topic: 1553 Message: 1556

```
Hi Sid,
This is what I have so far:
from softrock import hardware_usb_new as quisk_hardware
from softrock import widgets_tx as quisk_widgets

si570_direct_control = True
si570_xtal_freq = 114211833

sample_rate = 96000
playback_rate = 96000
name_of_sound_capt = "hw:1,0"
name_of_sound_play = "hw:1,0"
channel_i = 0
channel_q = 1

usb_vendor_id = 0x16c0
usb_product_id = 0x05dc

This works so far. The quisk display is working and the rig changes
frequencies. Again , I am sorry, but I don't find the names of the
variables intuitive in the least. What is the name of the variable for
the "speaker"? My audio output device is (hw:0,1). What do I assign
that to so I can hear the output of quisk?

If you type in a terminal aplay -l

this will list your soundcard outputs

its not exactly intuitive ... but logical order.

Topic: 1553 Message: 1558

Hi,
I don't think I am making myself clear. What is the Quisk variable name
I use so that I can hear the output of Quisk.
I know what the device name is: hw:0,1

From: Ron
Topic: 1553 Message: 1561

Hi Guys,
I really do apologize but I just can figure this out.
Here is a list of sound devices on my Raspberry Pi 2 (as reported by the portaudio pa_devs utility)
Name = bcm2835 ALSA: - (hw:0,0)
Name = bcm2835 ALSA: IEC958/HDMI (hw:0,1)
Name = Peaberry SDR: USB Audio (hw:1,0)
Name = C-Media USB Audio Device: - (hw:2,0)
Name = sysdefault
Name = dmix
Name = default

What are the configuration parameters in the .quisk_conf.py file to properly set up the sound devices? I would like to use the C-Media device for the microphone and speaker.
I just can't figure out what to do. I guess I'm so use to using HDSDR that I have a mental block. HDSDR has four parameters: "In from radio", "out to radio", microphone and speaker. In my limited view of the world there should be four Quisk parameters similar to HDSDR. One for input to Quisk from the Peaberry on board sound card (in this case hw:1,0), one for output from Quisk to the Peaberry on board sound card (hw:1,0), one for the microphone (hw:2,0) and one for the speaker (hw:2,0).

Again, I feel really stupid about this but I can't get it.

What is your microphone and speakers hooked to ?
to bcm2835 or C-media ?

si570_direct_control = True
si570_xtal_freq = 114211833

sample_rate = 96000
playback_rate = 96000
name_of_sound_capt = "hw:1,0"
name_of_sound_play = "hw:2,0"

microphone_name = name_of_sound_play # Name of microphone capture device
name_of_mic_play = name_of_sound_capt

channel_i = 0
channel_q = 1

usb_vendor_id = 0x16c0
usb_product_id = 0x05dc

1564. Re: [n2adr-sdr] Quisk 3.7.2

Yahoo group: n2adr-sdr
Date: 2015-07-30 19:21:55 UTC
From: Mike
Topic: 1519 Message: 1564

Hey Jim .. i just changed my .quisk_conf.py to

use

softrock_model = "RxTxEnsemble"
#si570_direct_control = True
#si570_i2c_address = 0x70

i'm still not getting repeater offset to work ....

Is there a way to run in debug only through usb_hardware.py ?

Is there a way to check that quisk is picking up the value True for
do_repeater_offset = True ?

From: Sid Boyce
Topic: 1553 Message: 1565

I can't find how Peaberry sound should be configured even looking at the
circuit diagram.
I am copying David, the designer of the Peaberry and the provider of
support in quisk.
I have only seen posts from David in the softrock40 Yahoo group.
73 ... Sid.

Yes. Go to the file softrock/hardware_usb.py, and change DEBUG to 1. That is,

DEBUG = 1

near the top of the file. Then run from a terminal and look at the debug output.

Jim

ok .. changed DEBUG = 1

but all i see is

Change to 147380000
Run freq 147380000
Change to 146875000
Run freq 146875000

when the Tx button is hit/pressed ... there is no other change to / Run freq

is there a way to know that repeater is enabled once quisk.py has been ran/started ?

wonder if the repeater offset is not being read properly from favorites

Hi Mike,

The "Change to" message means the frequency is being changed. The "Run freq" is the result of reading back the "Change to" frequency to see that it worked. If this change is in response to the Tx button, it indicates the frequency is being shifted by 505 kHz. If 505 kHz is the correct shift in your favorites, then Quisk is doing what you requested.

Jim

Hi Sid,

No I haven't had time. Please give me more information.

If the height is wrong, can you drag the window border to make it bigger? Is the width OK?

Hi Mike,

In a previous message you wrote:

ok .. changed DEBUG = 1

but all i see is

```
Change to 147380000
Run freq 147380000
Change to 146875000
Run freq 146875000
```

when the Tx button is hit/pressed ... there is no other change to / Run freq

That seems to mean Run freq did change. Please be sure you are testing correctly. This is from the file quisk_conf_defaults.py:

```
# Quisk can implement the frequency shift needed for repeaters. If the repeater frequency
# is on the favorites screen, and you tune close (500 Hz) to that frequency, and there
# is an entry in the "offset" column, and the mode is FM, and this parameter is True,
# then Quisk will shift the Tx frequency by the offset when transmitting. Your hardware
# file must define the method RepeaterOffset(self, offset=None).
do_repeater_offset = False
```

Jim

Nah ... that's kbara on 147.38+ and IEVHF on 146.88-
--- interesting that it's a diference of 500Khz .... repeater offset
should be 600Khz ...

my quisk_conf.py contains as its last line

do_repeater_offset = True

this is an output after i added some more debug lines to the debug IF
statment ..

```
odroid@odroid:~/Downloads/quisk7$ python quisk.py
Startup freq 7050000
Run freq 7050000
Address 0x55
Smooth tune 3500
RepeaterOffset True *<----- Jim , shouldn't this be a value that's in
the offset**field of favourites ?* not "true"

Hi Jim,
Only quisk and X live on so there is no window management.
quisk cannot be resized. It occupies 1/3 of the screen height and 3/4 of the width.

This is the script:-
Konsole output
```
root@hiqsdr:/opt/quisk-3.7.2# cat /home/hiqsdr/startHiQSDR
#!/bin/sh

export DISPLAY=:0

RESULT=`pgrep quisk`

if [ "${RESULT:-null}" = null ]; then
X &
ping -i 0.1 -c 2 192.168.2.196
(sleep 15s && xset -dpms; xset s off) &
cd /opt/quisk-3.7.2;python quisk.py
killall -r X
/usr/bin/fbi -T 1 -noverbose -a /etc/splash.png
sync
# sudo shutdown -h now
fi
```

This is a modified version of the rasdr script (startsdr), with "rasdr" replaced by the quisk lines.
In the case of rasdr it results in a full screen touch display as can be seen on my QRZ.com page and
http://dl2stg.de/stefan/hiqsdr/index.html

rasdr on the Pi model B
==========
Konsole output
```
root@raspberrypi:/home/hiqsdr# ps fax|grep X
1576 pts/0 S+ 0:00 \_ grep --color=auto X
25747 tty7 Ss+ 256:03 \_ X
root@raspberrypi:/home/hiqsdr#
```

quisk on the Pi 2

Konsole output
```
root@hiqsdr:/opt/quisk-3.7.2# ps fax|grep X
22851 pts/0 S+ 0:00 \_ grep --color=auto X
2559 tty7 Ss+ 135:24 \_ X
root@hiqsdr:/opt/quisk-3.7.2#
```

Hit power on and it boots up into rasdr, same for quisk -- operation is
all done using the touchscreen.
I have yet to wire in the ATMega328 to control the rotary encoders for
tuning and switch functions.
/etc/splash.png is a picture of the HiQSDR board that is displayed
before rasdr or quisk as appropriate.

Hi Sid,

Please try these changes. Starting from line 2730:

```
# print 'data, graph,fft', self.data_width, self.graph_width, self.fft_size
self.width = self.screen_width * 10 // 10
self.height = self.screen_height * 10 // 10
self.main_frame = frame = QMainFrame(self.width, self.height)
```

And on line 2819:

```
self.main_frame.SetClientSizeWH(ww, self.screen_height * 10 // 10)
```

These control the height. The width depends on your FFT size. Please tell me the FFT number of points from the config screen, and your screen size width and height in pixels. I may have to use a different top level window to fix this.

Hi Jim,
Another hopefully easy to fix one.

I would like to have the waterfall split so that e.g clicking on Wfall
will automatically split the display 50% spectrum and 50% waterfall.

I can do so manually using the mouse but touch doesn't bring up the
double-headed arrow to allow it to be done.
73 ... Sid.

There is a config option
waterfall_graph_size = 80

to set the initial waterfall size in pixels. Clicking on the waterfall tunes the frequency, so is not available. The problem is not to write the feature, but how to make the GUI.

1586. Quisk and WSPR

Yahoo group: n2adr-sdr
Date: 2015-08-05 04:16:39 UTC
From: la3jj@...
Topic: 1586 Message: 1586

Hi Jim and all,
I am using Quisk now with wspr. (or the other way around)
The OS is Ubuntu 15.04.
It has not been so easy until now because of the CAT problems mentioned in one of your documents.
Now with the wsjtx 1.6.0 dev the Hamlib is complete and includes rig 2.
So it was quite easy to get them running together using localhost:4575 ;-)

As you probably know wspr uses audio centered around 1500Hz.
So it would have been nice to be able to vary the bw around that and not with a fixed 300Hz offset in the DGT mode.
I have tried to make some small simple changes to the quisk.py file and ended up with something that looked very nice and 1500Hz-centered on the display. When testing it I found that the actual audio was still with 300Hz fixed offset. I have just entered into your Yahoo group and searched here but not found any clues?
Is there a way for doing this?
I am using the 3.6.22.

Hi Jim,
On reflection I thought it odd that the mouse could resize the waterfall height but touch couldn't.
Looking at it again, touch works but is a bit fiddly compared to using the mouse.

I kept at it until the dividing line was highlighted, the double headed arrow appears and the waterfall height can be adjusted.

Hi all, I have now downloaded and compiled the 3.7.2 version. it makes no difference for my application, as would also be expected from reading the change log.
My question is still open for any comment/advice. In a few days when I am back home I will read the code in quisk.py more carefully and try to understand why my first attempt to make DGT bw 1500Hz-centered did not succeed.

Hello Jon,

If I understand you correctly, you want a filter that selects a narrow bandwidth centered at 1500 Hz. But wspr is designed to work within the 3000 Hz bandwidth of a regular radio, and wspr does its own tuning and filtering. In the past, users have asked me to make the filter bandwidths wider, not narrower, so that fldigi (for example) could see and tune to more of the spectrum.

Take a look at the FDV mode, and see if the filters there are closer to what you want.

Thanks Jim and Mike for good advice. I have made some more changes to the code and it works!

I know Jim that WSPR is designed to work with full SSB bw.
Still at times with QRM from strong RTTY's I would like to be able to use a bit narrower pass-band. Now I have the full flexibility from 400 to 3000Hz centered at 1500.

The changes I made was quite easy, just changing the lines that control the display bw and the actual filter bw to the same code used for FDV! I have posted a last pixt that shows the success to the LA3JJ album.

1597. Mod to HiQSDR

Yahoo group: n2adr-sdr
Date: 2015-08-08 04:22:06 UTC
From: gvjury@...
Topic: 1597 Message: 1597

A while ago a mod to HiQSDR was published to improve the mid-range power and better working point for the MMIC with resultant improvment to IMD3. One of the things to do was to replace the choke L10 with a 2.2 uH choke. I did this but was never really happy with my result and figured that the Q of my replacement was very low and the DC resistance too high.

I measured a ferrite bead at 50 MHz with the VNA and found that 2 turns through it = 2.8 uH which is very close to the desired value. After installing this I got good improvements in power and a seemingly better output but it was only by observing the sinewave which seemed more sine like and is somewhat subjective.

I think this may be a very cheap effective way to do the mod with maybe some performance advantages.

Hi Graeme,

yes, you are right, hi-Q and low resistance is important for the choke.
I know that the proposed choke is hard to get due to its hi-Q, and your way to replace it is a perfect replacement!

1599. Quisk version 3.7.4

Yahoo group: n2adr-sdr
Date: 2015-08-10 16:19:04 UTC
From: jahlstr@...
Topic: 1599 Message: 1599

The Spot button transmits a variable level carrier in all modes, not just SSB. The new config file option "spot_button_keys_tx = True" will cause the Spot button to key the transmitter. The default is False. The up button for the Favorites screen used to set the frequency in Hertz, but the frequencies must be in Megahertz. The ctcss was also broken. This has been fixed.

I added a new Hermes-Lite model configuration file hermes/quisk_conf2.py. This is for use by people who can program in Python and want to add features to Quisk. It is set up to send the Spot button status on the J16 connector. Quisk now operates in CW mode using the new Hermes-Lite key input. For other modes, use the PTT button. On the Hermes,
use the PTT button with Spot, even for CW. The CW key always transmits full power CW even if the mode is not CW.

There is now an option to receive microphone samples from a UDP device. This is used for SDR hardware that has a built-in codec. See quisk_conf_defaults.py.

The FreeDV code was completely rewritten. It is now simpler, and it is easier to change to a newer libcodec2. See the file freedvpkg/README.txt. If anyone is running on Apple OSX, and has problems, email me, and look at freedv.c.

The config file option graph_width=0.8 sets the width of the graph. If this is set to exactly 1.0, Quisk will run in full-screen mode. This is meant for built-in screens, tablets etc. that lack window management.

Jim

Cool .. yep, ctcss ia fixed and worked IEVHF repeater with 18mW .....

using the graph_width= 1.0 didn't work for me ... its all good, i do
have screen management .... im not a tablet user.

Now new feature request .... ctcss squelch for FM ...
the existing squelch is kinda iffy.... even with a 20db difference (some
times) from floor to FM carrier it still might not open ...

Any ways.. guess its time to get to work and build a 11 element beam for
70cm and 1.25M .... and replace my Arrow Jpole .

Thanks for the wonderful work Jim ....

Hi Jim,
The width is fine but the height is still a bit more than 1/3 of the 7" screen.

I haven't altered quisk.py.
Options I have tried with and without graph_height=1.0:-
Konsole output
from hiqsdr import quisk_hardware

add_imd_button = 1
add_fdx_button = 1
latency_millisecs = 50
button_font_size = 10
graph_width=0.9
graph_height=1.0
waterfall_graph_size = 140
73 ... Sid.

In quisk.py with
Konsole output
self.height = application.screen_height * 10 // 10
The height is full screen but graph_width=0.9 cuts off most of Zo and I have to reduce it to 0.8 to get all in but I only get 3/4 full width.
73 ... Sid.

It looks like graph_width=1.0 is not going to be sufficient. Mike KC7NOA also reports problems. The exact width 1.0 triggers special code that should produce a full screen display, and does on my PC monitor. But I don't have a display without window management, and I don't have your exact display. It is always hard to write software that I can't really test.

I will try again for the next release. Meanwhile, if you want to experiment, look at quisk.py. The screen size is set at line 2640. This is used to set the window size at line 2754. The window is resized at line 2846. Searching for "if conf.graph_width" will show the new logic.

There is a complication that the graph width must be a sub-multiple of the FFT size, and the FFT size must have many small factors for efficiency. Another problem is whether the close-window "X" is in the top of the window in the case of no window management. That "X" is used to exit Quisk, and needs to be present.

It would help me if you could tell me the pixel size of your display, and the rectangle returned by wx.Display().GetClientArea() and wx.Display().GetGeometry(). And is there an "X" at the top of your window?

When i did graph_width=1.0 .. display was full height but about an inch wider than what my screen is .... guessing by what was cut off .... it was close.

Hi Jim,

Yet again thanks for the new Quisk and again with meaningful and useful changes. I have been away in our caravan and got back to find this little present. I will install it later today after I wade through the heap of list postings.

Particularly thanks for the spot button change. Making it a config option is a great idea as everyone can be satisfied. I also think extending the spot signal to J16 on HL is an excellent idea as I can use this to trigger my home made auto tuner. I will look into how I can use the "I have finished tuning" signal from the tuner to tell Quisk to finish spot tuning and report back in due course.

Great job!

Sid .. is that what the inserted print statements returned ....?

The specs for my display are the same as yours .... 800 X 480 .... but
1024 X 600 (returned value by print statement) seems to work fine ....

cant for the life of me remember how to get xrandr to tell me the
current resolution (ssh connection)

1622. Re: [n2adr-sdr] Quisk version 3.7.4

Yahoo group: n2adr-sdr
Date: 2015-08-13 18:57:30 UTC
From: Sid Boyce
Topic: 1599 Message: 1622

What I posted was just the part about the resolution.

I am using LXDE and lxrandr only offers that resolution and it's the default when I installed raspbian on the Pi 2.

I'll have to check the Pi model B to see what that comes up with.

I am running rasdr on the Pi model B and getting a display covering the complete screen area right up to the metal surround. I haven't tried quisk on the model B.
73 ... Sid.

1623. Re: [n2adr-sdr] Quisk version 3.7.4

Yahoo group: n2adr-sdr
Date: 2015-08-13 19:26:23 UTC
From: Sid Boyce
Topic: 1599 Message: 1623

Setting self.screen_height and self.screen_width in quisk.py to "10 //
10" it's close, 0.4" top and bottom borders and 0.3" left and right
borders with just Zo truncated.
Close enough to be usable.
Konsole output
73 ... Sid.

From: jahlstr@...
Topic: 1599 Message: 1624

Thank you to both Sid and Mike. I think we need a feature that starts with the window width and height in pixels, and tries to fit the graph inside. The current code operates the other way around, because it is depending on the window manager, and assuming that the user will resize the window. The complication is the FFT size, and thus the graph size. The FFT size must have many small integer factors for efficiency. This new feature will be in the next release. Let me know if you want an early version. The only changed file is quisk.py.

Jim

---- ditto ----
So I can test quisk on the Pi 2 which doesn't use a window manager.

With rasdr on the Pi model B it fills the screen with buttons large
enough to be used with a finger.
73 ... Sid.

1627. freedv

Yahoo group: n2adr-sdr
Date: 2015-08-15 00:32:28 UTC
From: Mike
Topic: 1455 Message: 1627

What happening with the freedv ...

i copied my arm codec2 (same that was used in a previous install) into freedvpkg folder ...

but now the freedv button does not light ...

the readme just has info on codec2 .. not the fmdm modem ...

you cant actually use the freedv program and the digital button ...
quisk does not let go of my microphone and speaker .... and when freedv starts it complains.

least thats what happens on my system ....

From: Sid Boyce
Topic: 1455 Message: 1628

You'll see freedv.c in the quisk-3.7.4 directory, the freedvpkg
directory only has libcodec2.so libraries which I replaced with the ones
installed when codec2-dev was built.

During make

Konsole output
gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv -O2 -Wall
-Wstrict-prototypes -fPIC -I/usr/include/python2.7 -c freedv.c -o
build/temp.linux-armv7l-2.7/freedv.o

Konsole output
gcc -pthread -shared -Wl,-O1 -Wl,-Bsymbolic-functions -Wl,-z,relro
build/temp.linux-armv7l-2.7/quisk.o build/temp.linux-armv7l-2.7/sound.o
build/temp.linux-armv7l-2.7/sound_alsa.o build/temp.linux-armv7l-2.7/so
und_portaudio.o build/temp.linux-armv7l-2.7/sound_pulseaudio.o
build/temp.linux-armv7l-2.7/is_key_down.o
build/temp.linux-armv7l-2.7/microphone.o
build/temp.linux-armv7l-2.7/utility.o build/temp.linux-armv7l-2.
7/filter.o build/temp.linux-armv7l-2.7/extdemod.o
build/temp.linux-armv7l-2.7/freedv.o -lasound -lportaudio -lpulse-simple
-lfftw3 -lm -o /opt/quisk-3.7.4/_quisk.so

Still -- FDV-U is greyed out. ldconfig finds the libraries
Konsole output
/usr/local/lib/arm-linux-gnueabihf/libcodec2.so
/usr/local/lib/arm-linux-gnueabihf/libcodec2.so.0.4

From: pascal@...
Topic: 1455 Message: 1629

Hi Mike, I got the same issue, and have to rebuild codec2 as Jim described in the readme.txt, and all is ok. I believe Jim has made changes in freedv and that make the olf freedv directory not compatible with the last release.

From: Sid Boyce
Topic: 1455 Message: 1630

Hi Mike,
freedv is built into quisk.
The freedv program built from fdmdv-dev is a standalone program which is also Softrock/UHFSDR aware.

Both would be attempting to use the same hardware and the one that has it would lock out access to the other just the same as would happen if 2 instances of quisk were attempting to use the same pieces of hardware.
73 ... Sid.

1631. Re: [n2adr-sdr] Re: freedv

Yahoo group: n2adr-sdr
Date: 2015-08-15 08:20:09 UTC
From: Sid Boyce
Topic: 1455 Message: 1631

```
Konsole output
slipstream:/usr/src/XXX/quisk-3.7.4/freedvpkg #file libcodec2*.so
libcodec2_32.so: ELF 32-bit LSB shared object, Intel 80386, version 1
(SYSV), dynamically linked,
BuildID[sha1]=fd21c7490e1a40c0dc445e8cd07d2c3566d35a64, not stripped
libcodec2_64.so: ELF 64-bit LSB shared object, x86-64, version 1 (SYSV),
dynamically linked,
BuildID[sha1]=1683d5d20c4b72b98c48b05a3380e3e7e921e092, not stripped

Those are x86 libraries which would have to be replaced by the ARM
libraries for RaspberryPi/ODROID.
73 ... Sid.

Looking in setup.py it's needing libcodec2_32.so which I have as a
symlink, alternatively the name can be changed in setup.py.
FDV-U is still greyed out.

Ok ....

Just trying to figure out how to un-grey the button ....

I'm not sure where it's legal to use though ....

I'd like to use it on 30m

Hi Mike,
freedv is built into quisk.
The freedv program built from fdmdv-dev is a standalone program which is
also Softrock/UHFSDR aware.

Both would be attempting to use the same hardware and the one that has
it would lock out access to the other just the same as would happen if 2
instances of quisk were attempting to use the same pieces of hardware.

Hello,

Please read the file freedvpkg/README.txt for complete instructions on how to install a valid codec2 and make the FDV button work.

Jim

Funy thing is .. i did read it ....

My return for version of codec2 was -2 ...

but i thought my local version of codec2-dev was current ... but after a
svn update and consequent build/install ....

quisk is running with fdv button working ....

once again "assume" strikes again.

1636. Re: [n2adr-sdr] Quisk version 3.7.4

Yahoo group: n2adr-sdr
Date: 2015-08-20 00:12:30 UTC
From: Sid Boyce
Topic: 1599 Message: 1636

I found a solution, using startx and automatically starting quisk then using the window manager to make it fullscreen.

Still having the display problem with BitmapFromData and having to use Wfall then reducing the waterfall height to display only the graph.

The Pi 2 with 4 CPU's can handle it all while the model B would probably struggle.

1638. Re: [n2adr-sdr] Quisk version 3.7.4

Yahoo group: n2adr-sdr
Date: 2015-08-20 07:28:12 UTC
From: Sid Boyce
Topic: 1599 Message: 1638

Hi Mike,
I am using quisk configs for different gear, HiQSDR on Pi 2 and
Hermes-Lite on ODROID-U3.

I have almost fullscreen on the Pi 2 which is also OK and I am happy
with that.
The BitmapFromBuffer errors on ARM is still a mystery, changing from 3,1
to 4,1 doesn't fix it like it did quite a while back.

I got a test version of quisk.py from Jim but quisk refuses to start
with it.
I sent Jim the error message a few days ago.
File
"/usr/lib/python2.7/dist-packages/wx-2.8-gtk2-unicode/wx/_windows.py",
line 497, in __init__
windows.Frame_swiginit(self,_windows_.new_Frame(*args, **kwargs))
TypeError: Expected a 2-tuple of integers or a wxPoint object.
using "DejaVu Sans Mono-16", pixelsize=16.67
file=/usr/share/fonts/truetype/ttf-dejavu/DejaVuSansMono.ttf
Server terminated successfully (0). Closing log file.
73 ... Sid.

1639. Re: [n2adr-sdr] Quisk version 3.7.4

Yahoo group: n2adr-sdr
Date: 2015-08-20 09:11:34 UTC
From: Mike
Topic: 1599 Message: 1639

Weird ... i don't get that error ...

though i did get an error .. it was because i needed to replace
quisk_conf_defaults.py too ....

and as always... im using the bmp = wx.BitmapFromBuffer*RGBA*(len(row)
// 4, 1, row)

On 08/20/2015 12:28 AM, Sid Boyce g3vbv@... [n2adr-sdr] wrote:

1640. Re: [n2adr-sdr] Quisk version 3.7.4

Yahoo group: n2adr-sdr
Date: 2015-08-20 17:10:44 UTC
From: Sid Boyce
Topic: 1599 Message: 1640

"4,1, row" used to work a long time ago, doesn't now neither on Pi 2 or
ODROID-U3.
73 ... Sid.

On 20/08/15 10:11, Mike Patriot121@... [n2adr-sdr] wrote:

From: Mike
Topic: 1599 Message: 1641

For me it was the addition of RGBA ... using the older command buffer

1642. Re: [n2adr-sdr] Quisk version 3.7.4

Yahoo group: n2adr-sdr
Date: 2015-08-20 20:48:03 UTC
From: Sid Boyce
Topic: 1599 Message: 1642

Thanks Mike,
That should be
Konsole output
bmp = wx.BitmapFromBufferRGBA(len(row) // 4, 1, row)

Forgot to check how I fixed it back in the early hours of 11/22/2012 by
adding RGBA and changing 3, 1, row to 4, 1, row.
Waterfall still looks as messed up as it was then.
Both Pi 2 and ODROID-U3 now OK.
73 ... Sid.

Konsole outp

Konsole output

1643. Re: [n2adr-sdr] Quisk version 3.7.4

Yahoo group: n2adr-sdr
Date: 2015-08-22 16:15:50 UTC
From: <Patriot121@...>
Topic: 1599 Message: 1643

So does mine .... well I get waterfall ... but it's 2/3" off from the graph ... so I don't use the waterfall ... but does work

Sent by Outlook for Android

On Thu, Aug 20, 2015 at 1:48 PM -0700, "Sid Boyce g3vbv@blueyonder.co.uk [n2adr-sdr]" <n2adr-sdr@yahoogroups.com> wrote:
Thanks Mike,
That should be
Konsole output
bmp = wx.BitmapFromBufferRGBA(len(row) // 4, 1, row)

Forgot to check how I fixed it back in the early hours of 11/22/2012 by
adding RGBA and changing 3, 1, row to 4, 1, row.
Waterfall still looks as messed up as it was then.
Both Pi 2 and ODROID-U3 now OK.
73 ... Sid.

Konsole outp

Konsole output

1644. Re: [n2adr-sdr] Quisk version 3.7.4

Yahoo group: n2adr-sdr
Date: 2015-08-22 23:10:29 UTC
From: Sid Boyce
Topic: 1599 Message: 1644

Same here but the colours are all messed up.
With a display of 14080 - 14275KHz, 14228 - 14275 is just a black
rectangle on the Wfall, must be to do with using RGBA.
73 ... Sid.

Where can I buy PCB HIQSDR v2.4 design RA4CJQ?

1647. Re: PCB

Hi,

what do you mean with "design RA4CJQ" ? I assume you are mixing up different things. The design done by Hellmut DB1CC you can buy at technologie2000.de. That design is usually meant when talking about HiQSDR and it has revision 2.4.
I think there are just the assembled and tested PCBs and no bare PCB.
Maybe there is another design by RA4CJQ, at least i do not remember out of the head.

I hope these comments are helpful for you.

http://technologie2000.de/bestellenorder/hiqsdr-trx.html
There is the HiQSDR bare PCB there for sale at 38 Euro.

There is also the Russian HiQSDR-mini 2.0
http://www.sdr-deluxe.com/publ/transiver_hiqsdr_mini_2_0/1-1-0-1 the
link to the store is broken.

The RA4CJQ transceiver is something else, it's a QSD/QSE design.

There is obviously some confusion about what he really needs.

Hi Rolin,

Nice job of this SDR software for support on HermesSDR and HiQSDR on
Windows platform.

Just a few abriviations:

1. Support for IP adress change (i don't use 192.168.2.196) on HiQSDR
is not possible.

2. Support for speaker output level for HermesSDR doesn't work.

regards

huib

Thanks for your notice.
1) You can change IP adress in link parameters. Ex. RCM on HIQSDR link and choose Properties. You can see parameters - ZeusRadio.exe hiqsdr ip=192.168.2.196 control=48248 rx=48247 tx=48249 codec=48250

It is work?

2) Headphones work good ? Problem only with speaker ?

Use last b58 version https://cloud.mail.ru/public/82j4/3s4odHgbZ
https://cloud.mail.ru/public/82j4/3s4odHgbZ

Hello Rolin,

Thanks for the reply

Speaker or Headphone on HermesSDR is functioning but not by volume
control on ZeusSDR application.

On the soundcard by PC Volume control works well.

Still have another question for the HiQSDRmini, is this PCB available ?

Regards

huib

Rolin,

I have tested de HiQSDR on the ZeusSDR application and so far everything
seems to work on Tx and Rx part.

On the Hermes I noticed that only Mic audio does not work on the same
audio-card as the speaker / headphone from that card.
When both audio ports on the same audio-card are available then
speaker-audio / headphone audio sounds clipped and disturbed.
Microfoon audio is sounds well.

Also Zeus-hermes application has problems to find the HermesSDR
ip-adress tested on AMD and Intel desktop systems.

I hope this is usefull information for you

regards

huib

Hello Rolin,

Small correction about mic-audio Hermes.

When there are different audio-cards are available then mic-audio and
speaker / headphone audio sounds well if mic-audio is not on the same
audio card as speaker / headphone audio.

regards

huib

"Speaker or Headphone on HermesSDR is functioning but not by volume control on ZeusSDR application."
Click left button mouse on the "PC" for get changes and right button mouse on the speaker icon for change microphone source.

"Still have another question for the HiQSDRmini, is this PCB available ?"

If you mean clear PCB boards - I nave little quantity of mini2 boards, with BGA package of FPGA.
If you mean assembled board, that is not available, project "Odyssey" now is currently active.

"When there are different audio-cards are available then mic-audio and speaker / headphone audio sounds well if mic-audio is not on the same audio card as speaker / headphone audio."

What problem with mic ? Bad sound ?

1657. Quisk 3.7.5

Yahoo group: n2adr-sdr
Date: 2015-09-11 16:16:56 UTC
From: jahlstr@...
Topic: 1657 Message: 1657

I changed the code for full-screen mode. You can now enter window sizes directly. See window_width in the file quisk_conf_defaults.py.

I added two more bits to tx_control for the FPGA protocol. I updated the PyUSB package that ships with Quisk to version 1.0.0b2.

The received characters from FreeDV now appear in the upper left of the graph. I added the new FreeDV 700 and 700B modes. Right-click the FDV button to select the mode.

To make it clear when buttons have added functions, I added a miniature slider to buttons that can be right-clicked, and a circular arrow to buttons that can be clicked repeatedly. This can be turned off in your config file.

Jim

What of them ? Hermes onboard microphone is work ? If some soundcards microphone doesn't work, please check him in other programm. Sorry, I didn't undestend your problem. Simple soundcard microphone certainly works, It is not first beta. What sound driver do you use ?

1660. 3.7.4 & 3.7.5 crash using pasuspender

Yahoo group: n2adr-sdr

From: g0izm@...
Topic: 1660 Message: 1660

Hello all

Is anyone else seeing anything like this?

In 3.7.4 and now 3.7.5 when I run quisk using pasuspender it crashes after a variable number of minutes (of the order 5 to 20) with error "WARNING: Child process terminated by signal 11" (Seg Fault in Python I guess?).

- 3.7.2 is stable when started the same way
- later versions are stable when run without pasuspender (but unusable for transmit because pulseaudio gives me an audio lag of several seconds).

There's no point I think in listing my setup in vast detail if I'm the only one with the problem but at a top level this is on Arch Linux with Cinnamon desktop.

Cheers
Ian

Intel or arm or ?

Im ok with no crashes for days ....

but iv not installed 3.7.5 yet .... just 3.7.4, im having fun on the local 2M FM repeaters ...

Odroid/UHFSDR/Ubuntu14.04

I'm not that experienced with pasuspender, but you can disable pulse audio autostart manually.

edit /etc/pulse/client.conf and change "autospawn = yes" to "autospawn = no". Then run "pulseaudio -k" and it should take care of it.

You can restart it when complete by running "pulseaudio --start" but at least in Ubuntu, it won't start automatically on login with autospawn turned off.

The lag with pulse audio was a show stopper for me. I would accumulate seconds of lag over just a few minutes. Short of modifying the code, there is no quick fix. I've been working with Jim on an improved implementation that fixes this.

Thanks - I should have thought of disabling pulseaudio completely. I only have it installed because it's a hard dependency of another package.

Quisk now seems to be running fine, so problem solved (or at least worked around).

Agree re: pulseaudio lag being a show stopper - I get crazy amounts of latency.

Ian

Quisk will have a new version of PulseAudio soon. It was contributed by Eric, KM4DSJ. Stay tuned.

Cool.... don't have issues on my OdroidX2 (that I'm aware of) but lower latency is always better ....

Well that was quick... I was going to offer to help test any new version with updated pulseaudio but it looks like I'm too late.

Just trying out 3.7.6 - so far it's a vast improvement.

Great work Jim & Eric - thanks

Ian

Hi Jim,
I have been trying to pin down the Waterfall display problem on ARM.
It needs wx.BitmapFromBufferRGBA.

Konsole output
This method can be used to create a wxBitmap inside of wxPython, using
wx.BitmapFromBufferRGB or RGBA.

bmp = wx.BitmapFromBufferRGB(surface.get_width(), surface.get_height(),
surface.get_buffer())

wx.BitmapFromBufferRGBA must be used if the surface contains per pixel
alpha data.

I don't know if it will require just a trivial patch.
73 ... Sid.

1668. Quisk 3.7.6

Yahoo group: n2adr-sdr
Date: 2015-09-17 12:24:42 UTC
From: jahlstr@...
Topic: 1668 Message: 1668

The PulseAudio code was completely rewritten by Eric Thornton, KM4DSJ. It now uses the asynchronous interface. This will:

1)Improve stability/performance. We can now manage latency events how we want to and prevent ever increasing latency due to CPU load or network delays. latency_millisecs in the quick_conf.py file will established the target buffer size for playback. Realtime latency for pulse audio streams is available on the config/status tab.

2)Allow connection to two different PulseAudio servers. The default connection is to the local machine for normal usage. A separate machine can be specified to pass IQ audio via the network. This is useful to utilize a Softrock or Peaberry via a raspberry pi or other remote computer. Specify IQ_Server_IP = "your.ip.here" in your quisk_conf.py to utilize this option. Be sure to set latency_millisecs to something reasonable (300 works for me over wifi). NOTE: To keep network congestion down, all modes except CW will "cork" the idle up/down IQ stream.

3)Quisk will attempt to utilize native 16 bit LE format if a PulseAudio sink is configured this way. Default fallback is Float 32. This reduces network overhead for remote IQ audio streaming while not losing resolution for any local streams that are configured as floating point.

Additional changes:
-Remote control of Softrock receivers via usbsoftrock. Add usbsr_ip_address = "your.ip.here", usbsr_port=port#, and import hardware_net.py in quick_conf.py to communicate with a usbsoftrock daemon. Start usbsoftrock on the remote machine with the -D option.

-Added a macports target to the makefile to utilize dependency libraries from macports. This option now allows use of PulseAudio on OSX.

Eric

Hi Sid,

OK, lets solve this. But I am mystified.

Both wx.BitmapFromBufferRGBA() and wx.BitmapFromBufferRGB() are part of the wx package. What happens if you use wx.BitmapFromBufferRGB()? Does it just not work, or does it give error messages? If wx.BitmapFromBufferRGB() is just missing from the ARM version, that would be surprising. But I can deal with it if necessary.

Jim

Hi Jim,
With BitmapFromRGBA I get no errors on STDOUT, it's only the Waterfall display that can only be adjusted by Ys between solid black and the colour display on the screenshot or Yz between solid white and the same odd colours. No signals can be seen on the Waterfall itself.

With BitmapFromBufferRGB, Graph is not displayed. With Wfall the display is the same as with RGBA and I get the following errors on STDOUT.
Konsole output
```
bmp = wx.BitmapFromBufferRGB(len(row) // 4, 1, row)
AttributeError: 'module' object has no attribute 'BitmapFromBufferRGB'
Traceback (most recent call last):

Hello Sid,

I'm sorry, I messed up. There is no BitmapFromBufferRGB(). The correct spelling is BitmapFromBuffer().

If you use BitmapFromBuffer() what happens? Do you get error messages like the ones you got before? If so, then BitmapFromBuffer() is somehow missing.

Jim

from memory .. that's the default configuration ....

and on Arm the spectrum(graph) does not work that way ....

On my system the i cant remember if the waterfall works with BitmapFromBuffer() --

Ill double check if Sid does not respond in a few hours ....

Hi Jim,
with BitmapFromBuffer() there is no Graph spectrum display. On Wfall the Graph spectrum display is there but the waterfall is a solid black rectangle, Ys and Yz have no effect.
73 ... Sid.

Hello Sid and Mike,

Please find OnGraphData() in quisk.py and replace it with this. It is at lines 1969 to 1988 in Quisk 3.7.6:

```
def OnGraphData(self, data, y_zero, y_scale):
sample_rate = int(self.sample_rate * self.zoom)
#T('graph start')
row = '' # Make a new row of pixels for a one-line image
gain = self.rf_gain
for x in data: # x is -130 to 0, or so (dB)
l = int((x - gain + y_zero // 3 + 100) * y_scale / 10)
l = max(l, 0)
l = min(l, 255)
row = row + "%c%c%c%c" % (chr(self.red[l]), chr(self.green[l]), chr(self.blue[l]),
chr(255))
#T('graph string')
# Perhaps use 4-byte pixels and BitmapFromBufferRGBA()
bmp = wx.BitmapFromBufferRGBA(len(row) // 4, 1, row)
bmp.x_origin = int(float(self.VFO) / sample_rate * self.data_width + 0.5)
self.bitmaps.insert(0, bmp)
del self.bitmaps[-1]
#self.ScrollWindow(0, 1, None)
#self.Refresh(False, (0, 0, self.graph_width, self.top_size + self.margin))
self.Refresh(False)
#T('graph end')
```

This is the whole function, but only two lines have changed:

```
row = row + "%c%c%c%c" % (chr(self.red[l]), chr(self.green[l]), chr(self.blue[l]),
chr(255))

bmp = wx.BitmapFromBufferRGBA(len(row) // 4, 1, row)
```

If it works I will move it to Quisk.

Jim

From: MIKE DURKIN
Topic: 1678 Message: 1680

Just trying to spark some thought on the issue .. though minor ...

When on FM and talking to some one or listening to a conversation, i usually turn off the squelch ...

I have seen that when i set the squelch just above the noise floor that a carrier that's 50db over the noise does not keep the squelch open (that's centred on that marker line).

tone squelch is another name for ctcss but used to open the receivers squelch (with a delay) rather than to get the repeater to transmit ....

In my screen shot you can see a tone being transmitted by the repeater with the persons voice ... and he has alot of deviation ... not clipping the repeaters filters ... but i think its close hi hi !!!

1681. error: quisk with pulse:usbdevice --> long string --> distorted screen

Yahoo group: n2adr-sdr
Date: 2015-09-24 09:08:00 UTC
From: michael.hartje@...
Topic: 1681 Message: 1681

I use the LINUX-Version of quisk.

When I use quisk with a usb softrock hardware with a "pulse:usb device" as a sound capture, this results into is a very long string shown at the bottom of the quisk window. This string is very much longer than the original window size. So the left part of the main quisk window is resized a little but not enough. The string is truncated - but not enough.

And the second half part of the buttons (modes, bandwidth, config ...) is not shown -- placed at the right border and outside of the quisk main window.

The use of quisk is impossible with this pulse:device!!!!

I tried to find the setup of the info string it in the sources -- but had no success.

Does anybody know of this problem and know ot a solution for this?

The solution could be: truncate the displayed string to 15 significant characters only to identify the sound card out of the list in the config dialog.

A trivial work around is not to use pulse but alsa -- then the displayed string is very short.

Any other hints to use the program quisk with the directive
sound_capture = "pulse:USB"
is welcome.

I tried this with Qusik versions 3.6.18,19,21,22 and 3.7.4,6 -- all the same result with sound capture from USB with softrock derivate

Thanks

vy 73

Hi Michael,

is this what you mean ?

https://groups.yahoo.com/neo/groups/n2adr-sdr/photos/photostream/lightbox/161618426?orderBy=mtime&sortOrder=desc&photoFilter=ALL#zax/161618426 https://groups.yahoo.com/neo/groups/n2adr-sdr/photos/photostream/lightbox/161618426?orderBy=mtime&sortOrder=desc&photoFilter=ALL#zax/161618426
In this screenshot it seems to work well. So maybe the problem is not related to the string in the display but to some other issue with pulse or the soundcard itself.

Since the pulse code changed from 3.7.4 to 3.7.6 and the soundcard works with access from alsa directly i would assume that pulse has a problem with this usb soundcard.

Do you see any samples coming in from the soundcard in the config dialog if you use pulse ?
Is there any special reason to use pulse for the sample input ?

regards
Mario

Michael,

Can you post the output of "pacmd list-sinks" and "pacmd list-sources" from
the command line?

Also, a screenshot would help or at least what the long string is. What
type of usb sound card is it? Pulse name strings are usually somewhat long
anyway, but it world help to know the exact string.

Locate the source and sink you want to use, and type in pulse:full-name and
see if that works.

Thanks to Mario,

the pulse input is working and produces samples as well as sound, but as you can see in the screenshot, the program window of qusik is unusable.

pulse is updated interface in 3.7.6, as you mentioned. And most distributions (linux) use pulse at the default sound system. -- so does mine (elder linux mint, debian with cubieboard (1+2) and raspi (1 a + b), opensuse 13.2

This is also needed, when you want to use quisk with fldigi or with remote softrock -- as I found out.

Operation with fldigi can also be done via a special configuration with alsa -- approved here. the remote feature is under construction (configuration is not ready)

Hope, this answers your questions.

Michael,

Ok. This is good news and means the audio system is working as intended, we just need to fix the screen issue or truncate the information widget. The pulseaudio name looks valid and correct, just the vendor id is long.

I can look at the python code later tonight and see if there is a way to truncate it. If anyone else knows if a way to predetermine the window size, that may be a temporary workaround.

Hello Eric,

thanks for evaluating my data of the sound system.

I am awaiting very interested your come back from the diving into the code.

I myself tried several changes in quisk.py and in quisk_widgets.py as well as in the softrock/widgets_tx.py with some reactions, but not the expected harmless truncation ;-)

So hopefully you have a better knowledge of the code structure than I.

thanks

vy 73 and success diving into the py-code

Looks like a display type problem.

With those platforms you have to change quisk.py, certainly on the Pi. I have had to do this for the
Pi 2, ODROID-C1 and -U3 with 7 inch HDMI touchscreens and a 22 inch HDMI monitor.
Konsole output

```
row = row + "%c%c%c%c"% (chr(self.red[l]), chr(self.green[l]),
chr(self.blue[l]), chr(255))
#T('graph string')
# Perhaps use 4-byte pixels and BitmapFromBufferRGBA()
bmp = wx.BitmapFromBufferRGBA(len(row) // 4, 1, row)
```

Lines changed "row =" and "bmp = wx.BitmapFromBuffer"

Though you obviously have no problem with audio or IQ volumes being low, should you ever have, adjust with pavucontrol.

Hello Sid,

thanks for your input.

The screenshot was made on an old laptop 1024x768 (i386) -- a dell x300.

but is is the same result on opensuse 13.2 with 27'' 1920x1280.
My results were on all platforms and with all different screens very similar.

Your code lines are very welcome to me, but I can not interpret where to put them; what is v3.7.6 and what is your change / proposal.

are you able 8have the time) to give some better advice how to use your proposals and what can be expected with regard to the abbreviation of the of info string in the box at the bottom of of the main window?

thanks

1690. example for headless remote controlled softrock (simple TRX)?

Yahoo group: n2adr-sdr
Date: 2015-09-25 09:48:28 UTC
From: michael.hartje@...
Topic: 1690 Message: 1690

Dear List,

I am interested in some more advices for a configuration with a softrock (simple TRX with soundcard as A/D D/A IQ-sampler)

I found several different opportunities for different hardware in the quisk_conf_default.py

1. SDR-IQ
2. N2ADR HPSDR
3. Hermes lite

4. different concepts of rx_upd, radio_sound_ip

so for me there comes up some questions, when I want a setup with a simple headless (ARM-System with Linux) as a remote controlled softrock TRX-controller where the antenna cable ends, which can be used comfortable at other places in the LAN area with quisk.

I know of usbsoftrock -D or rigctld -m 2509, which can control the (softrock) TRX, when started on the remote station.
I think -- not tested -- there is a simple config available in quisk to use this remote system setup.

My questions are headed on the use of the IQ-Samples-Transfer.

The easiest way on the remote station could be done with netcat daemon/server in a pipe:
arecord ..... | nc -u ......
and vice versa for the IQ-Samples for TX-Path

But: how to get these samples into quisk on the client side? (out of quisk)

Are there other concepts realized in quisk, which can be used for such a simple remote setup?

Has anybody done an example configuration or documented setup of this system?

Thanks for reading and thinking about

Michael,

I am using a soft rock with a headless raspberry pi in my setup. This is the exact reason I rewrote the pulseaudio backend that is in version 3.7.6. Take a look at the instructions I wrote below for using a raspberry pi. I am using a Wolfson Pi sound card, but a USB sound card can also be used (they are limited in sample resolution though).

Look over what I wrote below and let me know if you have any questions.The walkthrough is mostly up-to-date.

I would have thought the old laptop would have been OK without the patch
but you can try it, likewise for openSUSE.

I have 3 openSUSE x86_64 boxes and 2 Kubuntu x86_64 boxes without the
patch.
ODROID-C1, ODROID-U3 both with Xubuntu and Pi model B/Pi2 with Raspbian
Wheezy with the patch.

Move quisk.diff.gz into the quisk-3.7.6 directory.
"gzip -d quisk.diff.gz" to get quisk.diff, apply the patch as shown
below. It should apply cleanly.

Konsole output
quisk-3.7.6 #patch -p1 < quisk.diff
patching file quisk.py
quisk-3.7.6 # python quisk.py
Should be AOK.

Hi Eric,
Good stuff.

Check out ghpsdr3-alex at http://napan.ca/ghpsdr3/index.php/Main_Page

Currently it supports HPSDR, Softrock, UHFSDR, Microtelecom Perseus,
SDR-iq, HiQSDR, Ettus Research USRP and rtl-sdr
<http://napan.ca/ghpsdr3/index.php/RTL-SDR> DVB-T dongles.

You can see some of the gear that's up
http://qtradio.napan.ca/qtradio/qtradio.pl

Using QtRadio they are all accessible over the internet and if they are
launched as shared they can be tuned if you are Master (the first one
on) or listen if you are only a slave connection.

e.g softrock is the server that talks to the radio, dspserver puts the
radio on the internet and QtRadio on a PC or glSDR from Google Play
store on Android tablets or phones for access.

TX over the LAN or the internet is controlled by ID and password set in
~/dspserver.conf and QtRadio or glSDR.
73 ... Sid.

Thanks for the good documented example -- that is what I hoped to find by.

I have 1 question and a remark
1. Question
You explained 3 methods for pulseaudio network transfer. The first "direct" mode showed a bug, which is overloaded by your additions to quisk. I think that 3.7.6 has included this enhancement. so your mentioned Step 9 is not needed anymore?

From the summary I expect that the "direct" mode produces the lowest network traffic; so I will try to use this mode.
And I hope this is working...

my remark is on the line starting with "Modify /etc/pulse/default.conf on the rpi ..."

It should be /etc/pulse/daemon.conf on the server(rpi) - the default.conf does not exist...
Am I right?

hello Sid,

thank You for the patch file.

I applied it to quisk.py (version 3.7.6)

The results are not as expected. (no change to former state - see attached file)
Sorry to report this....

any further idea to truncate the log string?
is it this lines where the info box is formed?
should we reduce the string before calling this line?

Michael,

Apparently I do need to update the page as you correctly identified those issues.

Yes, with version 3.7.6, you can use the direct mode simply by supplying the IQ_Server_IP variable. With the code changes, the bug that resulted in distorted audio is fixed.

You are also correct that step 9 is no longer needed with 3.7.6 as long as you have a 32 bit system.

default.pa and daemon.conf ate the two pulseaudio files to modify in /etc/pulse.

From: Sid Boyce
Topic: 1681 Message: 1698

```
Konsole output
Perhaps the names can be truncated as shown.
Suggest trying some others for name_of_sound_capt.
root@odroidu3:/opt/quisk-3.7.6# grep pulse quisk_conf_defaults.py
# For PulseAudio devices, use the name "pulse:name" and connect the streams
# to your hardware devices using a PulseAudio control program. The name
"pulse"
# Use the default pulsedevice for radio sound:
#name_of_sound_play = "pulse"
#name_of_sound_play =
"pulse:alsa_output.usb-0d8c_USB_Sound_Device-00-Device.analog-stereo"
#name_of_sound_play = "pulse:alsa_output.usb"
#name_of_sound_play = "pulse:CM106"
show_pulse_audio_devices = True

This last line above when included doesn't seem to do anything different
in my setup for Hermes/Hermes-Lite and HiQSDR which only use sound cards
for Mic/Speakers. With or without Config --> Sound shows both alsa and
pulseaudio card names.
73 ... Sid.

Hello Michael,

Please find the file softrock/widgets_tx.py and change the last line from:

```
gbs.Add(self.info_text, (4, 0), (1, 14), flag=wx.EXPAND)
```

to

```
gbs.Add(self.info_text, (4, 0), (1, 27), flag=wx.EXPAND)
```

The only change is to replace "14" with "27". This will make the line at the bottom of the screen wider and may be enough to accommodate the text. If not, please reply, and I can suggest another change.

Jim

Hello Eric,

I need some assistance to bring the system up.

All steps are done, but I have an additional step to do, to fetch the the audio devices on the quisk-stn (client). (with paprefs on the client I have to activate the network access --> find pulseaudio-devices)
And I have to activate in the /etc/pulse/default.pa (on the server)
load-module module-native-protocol-tcp auth-ip-acl=127.0.0.1;192.168.0.0/16 auth-anonymous=1
load-module module-zeroconf-publish
when missing the line ...zero-conf... there was no access (not listed) to the remote audio devices on the client.

The server "X300" (softrock-stn) has the IP 192.168.51.70
you find the output of pacmd list-sources and list-sinks on the client-stn attached, as well as the X300-lima_conf.py and the screen shot of the messages from start quisk start_quisk.log. The log shows, that the usbsoftrock seems to communicate. Quisk shows the main window and closes this window immediatly after start. (something must be wrong) --> see start_quisk.log

There is a difference to your quisk_conf.py in the remote devices: mine have additional "tunnel"

The question is:
1 is tunnel the sign for your third transfer model "native tunnel"?
2. how can I access the "direct" mode? (--> see at list-sources) ?

I fear this could be too complicated for a remote analysis - but I give it a try.

thanks in advance

Michael

Don't worry about that. With the direct mode, all you need to do is supply
quick with the IQ_Server_IP="xxx.xxx.xxx.xxx" variable in your
.quisk_conf.py file and it will find the server. No need for the
"module-zeroconf-publish" line. That is only needed for using "paprefs" to
enable the tunnel mode. I'm sorry for the confusion. I will simply my
instructions since Quisk now has the necessary changes to not worry about
tunnels.

Try this change:

name_of_sound_capt =
"pulse:alsa_input.usb-VIA_Technologies_Inc._VIA_USB_Dongle-00-Dongle.analog-stereo"

name_of_mic_play =
"pulse:alsa_output.usb-VIA_Technologies_Inc._VIA_USB_Dongle-00-Dongle.analog-stereo"

name_of_sound_play and microphone_name can be one sound card -
Mic/Speakers connection.

name_of_sound_capt and name_of_mic_play -- is the card connected to the
Softrock Line In and Line Out. It has to be a different sound card.

hello to all contributors to my question,

Many many thanks to all of you, thinking on a solution and contributing to it.

I have been out one day; so I tested these contributions now and here are some results.

To say it in short words: partly success needs some more refinements.
starting from the last mails:

@ Jim (and Rainer): Thanks for your contribution, which give a good step forward. But: As Rainer mentioned: the longer status filed helps a little, but not at all. Have a look for ...-3.png which shows the result:
1. The status filed is now as long as the main window is broad.
2. the long text is still not given in total
3. The long text now let increase the gap between both button blocks
4. The right button block now overlays the the 3 sliders right of the right button block
5. The far right button row in the right button block is compressed
6. As Rainer mentioned: the status window (see attached file ...-5.png) is not regular sized.
When I resize the the main window - it does not help realy -- on can see in ...-5.png that the buttons in the far right row are resized as well.

So I will come back to Jim's idea: there is to be done some further refinement. It could be one solution to shorten the string just for the display.

@Sid: Change of the variable show_pulse_audio_devices = True to false prevents the startup of qusik when configured with capture from pulse in my case. so this is not possible for me. -- I fear this does not bring the wanted solution. (I wonder what is the designed influence of this variable)

to conclude: There seems to be needed some further refinement in truncation of the displayed string. I personally prefer the truncation over distorted screen display.

Just an idea: the truncation could be:
1. hard truncation at the end of the displayed string
2. soft truncation: check for upper case letters and for "." and for "_". Then take the next 2 letters
example
alsa_output.usb-VIA_Technologies_Inc._VIA_USB_Dongle-00-Dongle.analog-stereo
will become
al_out.us_Te_In_VI_US_Do.an
It may be short enough and significant, when you compare it on the "sound-tab" of the config button.

Thanks for now to all for that

hello to Erich and others here on the list,

Thank you for adding some ideas and contributing to this question of a network example for the remote softrock.

I now have some first steps further and a partly success. (See screen shot on the "client" controlling the remote softrock.

But there are still some questions open for the full function.

1. As shown: the spot-button is deactivated -- there is also no function behind when using it on the client while it is full function with quisk on the "server" locally.

2. The microphone at the client does not operate as expected and is not transferred to the client, as well there seems to be a selection issue in my configuration.

3. PTT does operate, but no microphone sound is transferred from the client to the server -- no transmission ! (see below)

@Eric: As I spent some time understanding the concept of the names for the native tcp pulseaudio transfer, I like to recommend a step 9b

find out he full name of the capture and the microphone play devices on the server (remote softrock) by
pacmd list-sources | grep name:
which lists the available devices. Select the one used for the softrock for the clients quisk configuration file of step 10.

@ Eric: I am not sure, but there seems to be some difficulties with the selection of the microphone / headphone pulse audio devices on the client.
in the config button screen there was no movement in the interupts of the microphone and the level has been down to -85 dB on the client. (During local qusik on the server it works as expected.) -- may be this is a pulseaudio question not a question to quisk implementation of code.
At the moment RX is working, but TX not!
What is your experience - any further ideas where to look on?

Thanks
vy73
Michael

Hmm. Spot button is deactivated on my end too. I've never used it (always
used CW tone to tune). I'll look into it. It's probably a function of the
softrock_net.py that I missed.

Two quick things to verify:
1) Make sure you are in LSB or USB mode. If you're in USB-D mode it will
use the digital-input device.
2) It looks like from your earlier quick_conf.py file, you are trying to
use an alas "PCH" device for microphone? Pulseaudio may be blocking the
device on your local machine. If you open pavucontrol, can you see
movement on the bar when you talk? If not, then try to get the mic working
first. You can use pavucontrol to monitor the level for debug.

hello Jim (and others in the list),

I want to add an other screen shot on a 27"-monitor (1920*1200) made with a wide main screen of qusik.
We notice from the screen shot:
1. All elements are shown
2. the status line has the full width of the buttons in the main screen
3. the text in the status line fills not the length of the status line box
4. the gap between the 2 button blocks in the middle is increased
5. the far right row of the buttons in the right button block is 3 times more wide than normal size of these button row

So I fear there is a need of some good ideas where to change the program code for the generation of the lower part of the main window.

What is your impression?

Hello Michael,

I take it that this is the start-up screen.

Did you go from there to full screen or to Config->Status screen and back to the Graph screen ?

The screen shots show the start-up screen, the full screen, the Config-Status screen and return to the first screen, respectively.

Topic: 1681 Message: 1710

dear Rainer,

You are right: The last screen shot (...-8.png, today in the morning) was made with the startup screen of quisk. The screen width is not configured manual.

Most of the other screen shots are done on a 1024x768 screen with screen width set to 0.9.

Just to learn a bit more about quisk: Can you describe briefly, what is the outcome when knowing the screen width and the window width. As you may know: the fft size (graph) is not resized when you switch the window size to full screen and going back to normal window size. The horizontal size of the fft graph is not resized all the time.

Looking forward for your email

Hello,

There is a Quisk 3.7.7 beta bug-fix release available on james.ahlstrom.name to fix problems with the long PulseAudio names. If you are using PulseAudio, please give it a try. I will be away for two weeks, but I can work some more on this when I get back in case this is not a 100% fix.

Topic: 1681 Message: 1712

Hello Jim and Eric,

3.7.7 is excellent, the decoupling of graph/waterfall, left and right button fields, and status line s amazing.

The only minor glitch was found in first 4 lines of Config->Status, but perhaps these and the following lines may be reduced in length by removing one tab therefrom. Expanding the display to the full screen width resolves even this small problem

Pulse audio is very clean and may be in fact the way to go. You may even use it for testing the cleanliness of your supply voltage by looking at the graph on the center frequency. Ignition noise in a car shows up there as small spikes, so you know whether the engine is running .

Sorry, but I still did not find out how to add a screen shot on this web site.

Thank you so much for all your efforts.

73,
Rainer, DJ6OA

Fewer buttons would probably help.

I have no difficulty in seeing all of them but the small buttons may be
a problem for some with a shaky hand or very poor eyesight.

Using a mouse is more precise in getting the double-headed arrow to
appear for dragging the waterfall height down with a pointer.

All the buttons and sliders present no problem.

The display is 800x480.

The mode, filter and band buttons could probably be presented as drop
down lists.

1717. Feedback on Quisk 3.7.7

Yahoo group: n2adr-sdr
Date: 2015-10-08 09:16:54 UTC
From: dh5ym@...
Topic: 1717 Message: 1717

Hi,

last weekend i had the chance to use HiQSDR + Quisk in the Reg.1 UHF/SHF contest.
HiQSDR was used with a 1296MHz->29MHz transverter.
I found one bug i think (see below).

Some feedback:

Positive:
- badscope was extremely useful for dish operation (you do not need to tune all the time)
- CQ loop function integrated for SSB into Quisk is working good and avoids a lot of cable stuff
- CW keying with key-off delay was great. Even keying from paddle via the software keyer in the log software was working great (delay in quisk set to 30)
- the new pulse integration seems to work fine. I did not have any problems with TX and RX audio running via Pulse

Some points for further improvement:
- in split mode for CW the RIT function is not working for the main frequency. The RIT is only active for the Sub-RX. This means that you do not hear CW stations that call you on your working frequency while you listen to a second frequency in parallel. Thats the only real bug i discovered.
- The SSB cq loop can be interrupted by PTT but only in the GUI. Pressing the PTT key connected to the HiQSDR hardware does not interrupt or stop the CQ loop

First i missed the CW sidetone slider in Quisk 3.7.7. Then i figured out that i can switch it on by adding use_sidetone = 1 to my config. Then it appeared again.

For the Marconi Memorial Contest i want to use the setup with a 2m transverter again. Then i want to run local cwskimmer connected to quisk. For that i still need to figure out how to set the skimmer mid frequency to the same value than the mit frequency set in Quisk (the middle of the spectrum that comes from the hiqsdr). I assume this could be done within the cluster client functionality within Quisk. Does anyone have experience with that ?

regards
Mario

1718. Re: Feedback on Quisk 3.7.7

Yahoo group: n2adr-sdr
Date: 2015-10-08 12:21:06 UTC
From: dh5ym@...
Topic: 1717 Message: 1718

one more point: for the recording of received audio i noticed that the audio that is actually transmitted (except the audio that is generated by Quisk itself e.g. sidetone or cq-loop) ist not stored into the wav file. I guess that this cannot easily be changed. But it would be a nice too have because a QSO is much easier to find if the own transmission is in the recording.

Hi Jim,

many thanks !!!
My next plan is to work the Marconi Memorical contest on 144MHz in November. It is a 2m CW only competition.
I plan to use the HiQSDR with a ME2HT-Pro2 transverter and maybe 2 antenna systems.
I had a look to the DX Cluster functions. I will try to use it with a local skimmer. Dont know if that works out. Controlling Quisk from the great Tucnak log (OK1ZIA) works already. Also the CW keying via cwdaemon is working fine.

I just have to find a way to send a telnet command to the skimmer if the mid-frequency of the hiqsdr hardware is changed within Quisk in order to get the spots on the correct frequency. There is a command "skimmer/lo_freq" that could be used for that. Maybe you have a hint how to do that ?

regards
Mario

Quisk has external control for Hamlib and Fldigi. If your skimmer offers either of these protocols, you could try that. If not, you need to write a function in Python in your hardware file to send the telnet command when the frequency changes.

Topic: 1717 Message: 1722

Hi Jim,

i think i have to use the later one. I think Hamlib does not offer to read the center frequency of the HiQSDR hardware, right ?
I looked into the DX-Cluster functions yesterday and if i manage to read the VFO frequency from the dxcluster class i might be able to send the command.

regards
Mario

Topic: 1717 Message: 1723

Hi,

for the moment i used the dxcluster class and created a skimmerupdate class from that. That opens a second telnet connection to the skimmer. I pass the VFO variable to the class and if it changes i send the skimmer/lo_freq command. I just do that every second because otherwise the PC only checks for the VFO variable. I guess there is a correct way to do that but i am not a programmer. At least this works for the moment ;)

With the dxcluster class it was not directly possible since the read for the spots blocks until a complete spot is received.

regards
Mario

1724. Quisk on Raspberry Pi2 Advice?

From: w6jhb@...
Topic: 1724 Message: 1724

Hi - first post here for me, as I recall, and sorry if this is kinda long...

I recently completed building a SoftRock Ensemble RXTX. I did my initial testing using Rocky. Reception results were quite good. Transmitting was so-so. Had several strange issues that seem to change based on the day of the week! Voltage, resistance, and current readings looked good except for the voltage at the dummy load terminals. I'm not completely convinced that I have a hardware problem, but possibly Rocky doing something screwy. To add to the confusion (mine) I run Rocky on Windows 8.1, but under VMware Fusion on an iMac running OSX. I set it up like this just to ensure that my hardware was working; my eventual plan was to run some SDR application on my RPi to speak with the RXTX.

So, it appears that Quisk might be a real good choice for the RXTX and the RPi. But.... I'm not super experienced with Linux and wonder if it is something I can handle. Has anyone produced any sort of "cookbook" approach to installing Quisk on the RPi and making it work with an RXTX radio?

One other thing to add is that I have an extra Tascam US-125M external USB sound card that I want to use. For certain it works on my iMac, as I have used it with my Elecraft K3 to do JT65, JT9, and PSK31. It also "seems" to work with the RXTX in that kludgy Win8.1/VMware setup,with the RXTX...

Any suggestions would be greatly appreciated.

73, Jim / W6JHB

Hi Jim,
I shall reply later with a list of pre-req packages that need to be installed and other helpful information.

I recently replaced a Pi model B with a Pi 2 in my standalone HiQSDR. The Raspbian distribution is installed on the Pi 2 and runs quisk.

There should be no problems running the digital modes natively. I haven't tried them under quisk as they worked natively before DGTL was included in quisk and worked well with the RXTX.

Sid, thanks for the in-depth replies. I've got several non-ham duties to attend to today so I may not get to the RPi stuff as much as I want until Tuesday. But I can say that I'm looking forward to this experiment, as I was not at all happy trying to kludge things together in the Win/VMware/OSX environment. While every other Win-based product I used in that environ worked quite well, the SDR HW/SW stuff is another story! Because my original intent was to run my RXTX on the RPi anyway, it makes sense at this point to just go there and not give myself any more headaches.

Will post results and/or questions here when I'm back at it.

Jim (ex 360 assembler, COBOL, RPG programmer) :-)

Topic: 1724 Message: 1729

Hi Jim,
Going back to my start with the SR v6.3 I also had problems with Windows, especially programming the UWB (Universal Bit Whacker) for it despite all the expert advice. A guy suggested using fsusb under Linux and the job was completed in a few seconds, moved it back to XP and it worked.

Also there is a bit of jiggery pokery with Windows and USB to be able to detect the Softrock.

Even now on openHPSDR gear there are lots of reports of difficulty programming the FPGA which is a straightforward process on Linux, that's with the SDR connected via Ethernet.

Same problem here with time, hence slow progress with building hardware.

1730. replay recorded IQ-Samples into quisk

Yahoo group: n2adr-sdr
Date: 2015-10-26 17:22:46 UTC
From: michael.hartje@...
Topic: 1730 Message: 1730

hello list,

does anybody know a simple path, how to replay a recorded iq-sample wav-file into quisk. (recorded from softrock)

I want to use it to present some features of quisk concected to wsjt-x and fldigi.

did I missed some open or hidden features of qusik? (To my knowledge, there is a feature to record and replay audio (decoded) samples)

What is the easiest open way?
(may be loopback audio with wav-player and a special prepared quisk config file?)

Any other hints are very welcome

thanks
Michael

Hello Mario,

---In n2adr-sdr@yahoogroups.com, <dh5ym@...> wrote :
- in split mode for CW the RIT function is not working for the main frequency. The RIT is only active for the Sub-RX. This means that you do not hear CW stations that call you on your working frequency while you listen to a second frequency in parallel. Thats the only real bug i discovered.

I am not sure what to do about this. When you listen to two frequencies at once, you seem to need two RITs. Currently the RIT applies to the secondary Rx, and the Tx frequency is not changed. Why is applying RIT to the Tx channel better?

- The SSB cq loop can be interrupted by PTT but only in the GUI. Pressing the PTT key connected to the HiQSDR hardware does not interrupt or stop the CQ loop

I will change Quisk so that pressing the hardware PTT will interrupt the CQ loop provided that it is pressed in the gap between transmissions. That is how the VOX works currently.

Sid, got some time this afternoon and got started. Unfortunately, didn't get too far! First off, figured out that I needed SUDO in front of the first apt-get command. That worked out OK, as best I can tell. Where I ran into trouble was at the ./configure command in the next steps, right after changing to the codec2-dev directory. I get a "No such file or directory". What's needed for this to work? Also, a bit further down at the make install command, is it really supposed to have two ampersands (&&) in the line? I ask this because I need to type the commands in by hand, as I've no easy way to get it from your email (on my Mac) over to the Raspberry Pi.

1733. RE: [n2adr-sdr] Quisk on Raspberry Pi2 Advice?

Yahoo group: n2adr-sdr
Date: 2015-10-26 20:40:11 UTC
From: MIKE DURKIN
Topic: 1724 Message: 1733

I think codec2-dev needs a few more steps to install

from the codec2-dev directory .....

mkdir buildcode
cd buildcode
cmake ../

To: n2adr-sdr@yahoogroups.com
From: n2adr-sdr@yahoogroups.com

Subject: Re: [n2adr-sdr] Quisk on Raspberry Pi2 Advice?

Sid, got some time this afternoon and got started. Unfortunately, didn't get too far! First off, figured out that I needed SUDO in front of the first apt-get command. That worked out OK, as best I can tell. Where I ran into trouble was at the ./configure command in the next steps, right after changing to the codec2-dev directory. I get a "No such file or directory". What's needed for this to work? Also, a bit further down at the make install command, is it really supposed to have two ampersands (&&) in the line? I ask this because I need to type the commands in by hand, as I've no easy way to get it from your email (on my Mac) over to the Raspberry Pi.

forgot to add ...

sudo make install

if you look in the codec2-dev folder you will see a file called "README" ... you can open with just about anything and read its contents ... my add on instructions are almost identical to the install portion ... not bad from memory

Have a look at quisk_conf_defaults.py - Audio section.

record (red circle), playback (triangle on its side), File (red circle).
Select File and Record, then select File and playback.
e.g:- in ~/.quisk_conf.py
file_name_audio = "~/quisk.wav"
73 ... Sid.

1736. Re: [n2adr-sdr] Quisk on Raspberry Pi2 Advice?

Yahoo group: n2adr-sdr
Date: 2015-10-26 21:57:20 UTC
From: Sid Boyce
Topic: 1724 Message: 1736

Hi Mike & Jim,
My hurried instructions, codec2-dev needs those steps, then "make &&
make install".

Jim, make && make install" says do "make" and if successful do "make
install". It will only run "make install" if "make" completes without
errors.

You can of course run "make" and when it completes without errors, "make
install".
73 ... Sid.

From: Sid Boyce
Topic: 1724 Message: 1737

"sudo apt-get", "sudo make install" if the commands are executed as user.
I usually do all that stuff as root.
73 ... Sid.

From: James Bennett
Topic: 1724 Message: 1738

Wow - my head hurts. I ran some of the commands successfully, but had issues with others. I think perhaps many of the problems I encountered came from having some files at root and others not there, but in the pi directory. Would it be best for me to simply start over as root? By the way, I never was able to get that ./configure command to work. Ughhh...

And now you can see just how much of a rookie I am with Linux!

From: MIKE DURKIN
Topic: 1724 Message: 1739

your not going to for codec2-dev ... unless you run autoreconf -i first .. and dont need to if codec2-dev builds ok

even if it dosent.... reading the output text of the cmake ../ and make will give clues to what you need to get ...

From: dh5ym@...
Topic: 1717 Message: 1740

Hi Jim,

>I am not sure what to do about this. When you listen to two frequencies at once, you seem to need two >RITs. Currently the RIT applies to the secondary Rx, and the Tx frequency is not changed. Why is applying >RIT to the Tx channel better?

Yes indeed. The Main RX and the Aux RX both need a RIT. It can have the same frequency offset i think, so that you do not need an extra slider. As you said the RIT is applied to the Auxiliary RX currently. So the Main RX has a offset of 0 and you will not hear a CW station calling you on your Main frequency if you have the Auxiliary RX switched on.

>I will change Quisk so that pressing the hardware PTT will interrupt the CQ loop provided that it is pressed in >the gap between transmissions. That is how the VOX works currently.

That sounds like a good solution.

Thank you very much !

regards
Mario

Going back to the beginning. All runs fine until I get a “No such file or directory” for the ./configure command. How can I resolve this? Did some Googling, but nothing concrete to tell me where to go…

Sid, got some time this afternoon and got started. Unfortunately,
didn't get too far! First off, figured out that I needed SUDO in front
of the first apt-get command. That worked out OK, as best I can tell.
Where I ran into trouble was at the ./configure command in the next
steps, right after changing to the codec2-dev directory. I get a "No
such file or directory". What's needed for this to work? Also, a bit
further down at the make install command, is it really supposed to
have two ampersands (&&) in the line? I ask this because I need to
type the commands in by hand, as I've no easy way to get it from your
email (on my Mac) over to the Raspberry Pi.

long...

I recently completed building a SoftRock Ensemble RXTX. I did my
initial testing using Rocky. Reception results were quite good.
Transmitting was so-so. Had several strange issues that seem to
change
based on the day of the week! Voltage, resistance, and current
readings looked good except for the voltage at the dummy load
terminals. I'm not completely convinced that I have a hardware
problem, but possibly Rocky doing something screwy. To add to the
confusion (mine) I run Rocky on Windows 8.1, but under VMware
Fusion
on an iMac running OSX. I set it up like this just to ensure
that my

hardware was working; my eventual plan was to run some SDR
application
on my RPi to speak with the RXTX.

So, it appears that Quisk might be a real good choice for the
RXTX and
the RPi. But.... I'm not super experienced with Linux and
wonder if it
is something I can handle. Has anyone produced any sort of
"cookbook"
approach to installing Quisk on the RPi and making it work with an
RXTX radio?

One other thing to add is that I have an extra Tascam US-125M
external
USB sound card that I want to use. For certain it works on my
iMac, as
I have used it with my Elecraft K3 to do JT65, JT9, and PSK31.
It also
"seems" to work with the RXTX in that kludgy Win8.1/VMware
setup,with
the RXTX...

Any suggestions would be greatly appreciated.

73, Jim / W6JHB

Topic: 1724 Message: 1743

Yep, I had a feeling I could skip that line. I did the cmake and all was OK at that point.

Did the make and then sudo make install - no problems there, either.

Changed to the quisk-3.7.7 folder and tried the make command there - it failed looking for pulse/pulseaudio.h - No such file or directory

What is needed to get past this one? :-)

Jim

From: MIKE DURKIN
Topic: 1724 Message: 1744

i dont think Jim intended quisk to be installed that way ...

try ...

from quisk folder ....

sudo python setup.py install

To: n2adr-sdr@yahoogroups.com

Date: Tue, 27 Oct 2015 11:39:05 -0700
Subject: Re: [n2adr-sdr] Quisk on Raspberry Pi2 Advice?

Yep, I had a feeling I could skip that line. I did the cmake and all was OK at that point.

Did the make and then sudo make install - no problems there, either.
Changed to the quisk-3.7.7 folder and tried the make command there - it failed looking for pulse/pulseaudio.h - No such file or directory
What is needed to get past this one? :-)
Jim

Subject: Re: [n2adr-sdr] Quisk on Raspberry Pi2 Advice?

Going back to the beginning. All runs fine until I get a “No such file or directory” for the ./configure command. How can I resolve this? Did some Googling, but nothing concrete to tell me where to go…

JimOn Monday, Oct 26, 2015, at Monday, 2:57 PM, Sid Boyce g3vbv@... [n2adr-sdr] <n2adr-sdr@yahoogroups.com> wrote:Hi Mike & Jim,My hurried instructions, codec2-dev needs those steps, then "make && make install".Jim, make && make install" says do "make" and if successful do "make install". It will only run "make install" if "make" completes without errors.You can of course run "make" and when it completes without errors, "make install".73 ... Sid.On 26/10/15 20:40, MIKE DURKIN Patriot121@... [n2adr-sdr] wrote:
I think codec2-dev needs a few more steps to install

from the codec2-dev directory .....

mkdir buildcode
cd buildcode
cmake ../

Subject: Re: [n2adr-sdr] Quisk on Raspberry Pi2 Advice?

Sid, got some time this afternoon and got started. Unfortunately, didn't get too far! First off, figured out that I needed SUDO in front of the first apt-get command. That worked out OK, as best I can tell. Where I ran into trouble was at the ./configure command in the next steps, right after changing to the codec2-dev directory. I get a "No such file or directory". What's needed for this to work? Also, a bit further down at the make install command, is it really supposed to have two ampersands (&&) in the line? I ask this because I need to type the commands in by hand, as I've no easy way to get it from your email (on my Mac) over to the Raspberry Pi.

long...

I recently completed building a SoftRock Ensemble RXTX. I did my
initial testing using Rocky. Reception results were quite good.
Transmitting was so-so. Had several strange issues that seem to
change
based on the day of the week! Voltage, resistance, and current
readings looked good except for the voltage at the dummy load
terminals. I'm not completely convinced that I have a hardware
problem, but possibly Rocky doing something screwy. To add to the
confusion (mine) I run Rocky on Windows 8.1, but under VMware
Fusion
on an iMac running OSX. I set it up like this just to ensure
that my
hardware was working; my eventual plan was to run some SDR
application
on my RPi to speak with the RXTX.

So, it appears that Quisk might be a real good choice for the
RXTX and
the RPi. But.... I'm not super experienced with Linux and
wonder if it
is something I can handle. Has anyone produced any sort of
"cookbook"
approach to installing Quisk on the RPi and making it work with an
RXTX radio?

One other thing to add is that I have an extra Tascam US-125M
external
USB sound card that I want to use. For certain it works on my
iMac, as
I have used it with my Elecraft K3 to do JT65, JT9, and PSK31.
It also
"seems" to work with the RXTX in that kludgy Win8.1/VMware
setup,with
the RXTX...

Any suggestions would be greatly appreciated.

73, Jim / W6JHB

You can Cut & Paste the errors for more help.
All on the path to becoming an expert.

I once had to talk a ham through building and installing a linux kernel over the phone. After that exercise he was able to talk someone else through the same.

If you have trouble with sudo, open a terminal "sudo su" and give it your user password and it will change the prompt from $ to #. You can then enter all commands without sudo.

If you are user some commands that need root access will not work, e.g "make install", that then needs to be "sudo make install". Same "apt-get install xxx" would need "sudo apt-get install xxx".

svn co https://svn.code.sf.net/p/freetel/code/codec2-dev

cd codec2-dev
mkdir build
cd build
cmake ..
make -j 4
make -j 4 install
73 ... Sid.

Seems more packages required. Not all of these needed but they may come
in useful for other stuff later.

apt-get install libpulse-dev pulseaudio libpulse0 libpulsedsp
pulseaudio-module-gconf pulseaudio-module-x11
pulseaudio-module-zeroconf pulseaudio-utils
73 ... Sid.

1748. RE: [n2adr-sdr] Quisk on Raspberry Pi2 Advice?

Yahoo group: n2adr-sdr
Date: 2015-10-27 22:17:31 UTC
From: MIKE DURKIN
Topic: 1724 Message: 1748

Sid ...

Whats the diference between

cmake ../

and

cmake ..

Mike KC7NOA

1749. Re: [n2adr-sdr] Quisk on Raspberry Pi2 Advice?

Yahoo group: n2adr-sdr
Date: 2015-10-27 22:55:17 UTC
From: Sid Boyce
Topic: 1724 Message: 1749

No difference at all, both says one directory back.
Whatever the user fancies, I have always used .. when ../ is stated,
some prefer ../

"cd ../.." or "cd ../../" to go 2 directories back.

ghpsdr3-alex/trunk/src/QtRadio
"cd ../../.." or "cd ../../../" takes you back to ghpsdr3-alex.
73 ... Sid.

1750. Re: [n2adr-sdr] Quisk on Raspberry Pi2 Advice?

Yahoo group: n2adr-sdr
Date: 2015-10-27 23:57:23 UTC
From: James Bennett
Topic: 1724 Message: 1750

Yes, I had intended to do just that (post the error message). However, technology has gotten in the way! I thought I'd just cut/paste those errors into a mail message in my Yahoo account and send it over to my ARRL.Net <http://arrl.net/> account where I could reply to the group. But, as the electron Gods saw fit, for some reason on my RPi, I am today unable to either compose a new email or even reply to one. I click on the compose icon in Yahoo mail and it simply ignores me. Have re-booted the RPi and got no change. I've never been in love with Yahoo mail and today puts an exclamation point on it. I suppose I should investigate another mail client and server, but that's just one more thing on the "to do" list for this SoftRock project. Arrghhhhh…….

Subject: Re: [n2adr-sdr] Quisk on Raspberry Pi2 Advice?

Sid, got some time this afternoon and got started. Unfortunately,
didn't get too far! First off, figured out that I needed SUDO in front
of the first apt-get command. That worked out OK, as best I can tell.
Where I ran into trouble was at the ./configure command in the next
steps, right after changing to the codec2-dev directory. I get a "No
such file or directory". What's needed for this to work? Also, a bit
further down at the make install command, is it really supposed to
have two ampersands (&&) in the line? I ask this because I need to
type the commands in by hand, as I've no easy way to get it from your
email (on my Mac) over to the Raspberry Pi.

I recently completed building a SoftRock Ensemble RXTX. I did my
initial testing using Rocky. Reception results were quite good.
Transmitting was so-so. Had several strange issues that seem to
change
based on the day of the week! Voltage, resistance, and current
readings looked good except for the voltage at the dummy load
terminals. I'm not completely convinced that I have a hardware
problem, but possibly Rocky doing something screwy. To add to the
confusion (mine) I run Rocky on Windows 8.1, but under VMware
Fusion
on an iMac running OSX. I set it up like this just to ensure
that my
hardware was working; my eventual plan was to run some SDR
application
on my RPi to speak with the RXTX.

So, it appears that Quisk might be a real good choice for the
RXTX and
the RPi. But.... I'm not super experienced with Linux and
wonder if it
is something I can handle. Has anyone produced any sort of
"cookbook"
approach to installing Quisk on the RPi and making it work with an
RXTX radio?

One other thing to add is that I have an extra Tascam US-125M
external
USB sound card that I want to use. For certain it works on my
iMac, as
I have used it with my Elecraft K3 to do JT65, JT9, and PSK31.
It also
"seems" to work with the RXTX in that kludgy Win8.1/VMware
setup,with
the RXTX...

Any suggestions would be greatly appreciated.

From: James Bennett
Topic: 1724 Message: 1752

I installed Chromium on the RPi and Yahoo mail works on that browser, but not on the supplied Epiphany browser, although it did yesterday. Maybe it only works on Mondays…

Anyway, here is a cut/paste of what happened when I tried to run: sudo python setup.py install running build_ext

```
.
.
.
.
.
building 'quisk._quisk' extension
gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes -fPIC
-I/usr/include/python2.7 -c quisk.c -o build/temp.linux-armv7l-2.7/quisk.o
gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes -fPIC
-I/usr/include/python2.7 -c sound.c -o build/temp.linux-armv7l-2.7/sound.o
gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes -fPIC
-I/usr/include/python2.7 -c sound_alsa.c -o build/temp.linux-armv7l-2.7/sound_alsa.o
gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes -fPIC
-I/usr/include/python2.7 -c sound_portaudio.c -o
build/temp.linux-armv7l-2.7/sound_portaudio.o
gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes -fPIC
-I/usr/include/python2.7 -c sound_pulseaudio.c -o
build/temp.linux-armv7l-2.7/sound_pulseaudio.o
sound_pulseaudio.c:40:30: fatal error: pulse/pulseaudio.h: No such file or directory
compilation terminated.
error: command 'gcc' failed with exit status 1
```

I will try running the apt-get stuff you recommended and see if that clears it up…

Thanks again!

From: James Bennett
Topic: 1724 Message: 1753

Ran the recommended installs. All worked except two: libpulsedsp and pulseaudio-util came up with “unable to locate package” errors.

I ignored it and ran the python setup.py install - had no errors, so I’m guessing those two packages are not really needed?

My next hurdle is to figure out how to create that 99-softrock.rules file in the /etc/udev/rules.d/ directory. I can see the directory from within the PCManFM (lightweight file manager) GUI but at that point I do not have permission to update the /etc… directory. Suggestions on this one?

sudo nano /etc/udev/rules.d/99-softrock.rules

this is also in the quisk online instructions (some where)

Thanks Mike - that worked just fine. I'd never used nano before, but it was just what the doctor ordered!

1756. Quisk / Raspberry Pi Errors

Yahoo group: n2adr-sdr
Date: 2015-10-28 17:15:16 UTC
From: James Bennett
Topic: 1756 Message: 1756

Sorry to be such a pest/rookie, but I need more assistance. I “think” I successfully did the install of Quisk on my Raspberry Pi 2, and gave it a try this morning. The results were rather disappointing, but at least some progress was seen. Upon startup I got a bazillion errors and warnings, and at this point not where to start. I’ve copied them and they are pasted below. In addition, I’ve included the contents of my quisk-conf.py file, below the error paste. Additionally, once started, Quick was completely unresponsive. No buttons were clickable and the application would not end normally - had to have it killed off. Some initial background data: Radio is a SoftRock Ensemble RXTX, sound card is a Tascam US-125M (external USB-attached). Help on this would be much appreciated!

The errors at startup: ————————————————————————>

```
pi@raspberrypi ~ $ quisk

1757. Quisk WIN10 installation

Yahoo group: n2adr-sdr
Date: 2015-10-28 22:04:19 UTC
From: artus1947@...
Topic: 1757 Message: 1757

Not having much luck with a Windows 10 64-bit machine. Anyone have it running under windows 10? I have latest 32 bit Python 2.7.10 installed and 32bit version of WXPython. Whenever I execute: C:\python27\pythonw.exe quisk.py from a command prompt in the quisk source directory, I get a flicker of the command box but nothing else. I looked for log entries but not finding any. Is there any verbose flag toggle to get error messages. Thanks

73,
Jack (W0FNQ)

Attachments: 1 described; binary payloads are missing from this source WARC

Or as root without sudo.

sudo apt-get install libpulse-dev pulseaudio-utils

sudo edit /etc/udev/rules.d/99-softrock.rules

Cut & Paste the data between the --- CUT --- lines and save it.

Or using the attached file "gzip -d 99-softrock.rules.gz"
"sudo mv 99-softrock.rules /etc/udev/rules.d/"
73 ... Sid.

1759. Re: [n2adr-sdr] Quisk / Raspberry Pi Errors

Yahoo group: n2adr-sdr
Date: 2015-10-29 02:37:42 UTC
From: Sid Boyce
Topic: 1756 Message: 1759

```
name_of_sound_play = "hw:0" ## built-in sound card used for Speakers.
microphone_name = "hw:0" ## built-in sound card used for Microphone
name_of_mic_play = "hw:1" ## send Microphone samples to the Softrock

The RXTX needs 2 sound cards, one stereo card that can be considered
part of the rig (does I-Q processing) - hw:1 in this case and hw:0 for
Mic/Spkrs.

I could not get the on-board sound to work with the original Pi model B
for Mic and Speakers so I used a USB sound card. I didn't try it with
the Pi 2. I used the original USB dongle with my standalone HiQSDR and
Hermes-Lite both of which only needs a sound card for Mic/Speakers.

Looking at the Tascam US-125M manual it says 48K samplerate max. In
~/.quisk_conf.py set
sample_rate = 48000

Most of the output messages are just noise and can be ignored.

There used to be a display problem on ARM with line 2012 of quisk.py set to
bmp = wx.BitmapFromBufferRGB(len(row) // 3, 1, row
That was fixed in quisk-3.7.7.

# grep -n wx.BitmapFromBufferRGBA quisk-3.7.7/quisk.py
2012: bmp = wx.BitmapFromBufferRGBA(len(row) // 4, 1, row
73 ... Sid.

1760. Re: Quisk / Raspberry Pi Errors

Yahoo group: n2adr-sdr
Date: 2015-10-29 04:12:23 UTC
From: rainerfeldkamp@...
Topic: 1756 Message: 1760

Hello James,

Your set-up has at least two serious flaws.

If you downloaded Quisk as a package from any of the Linux repositories, delete the package before doing anything else.

First, you obviously did not read the 'Documentation for Quisk' (ask Google for quisk, second entry in the search results). Under the heading 'Linux', you will find a nice list of packages to be installed. The fftw3 package has to be downloaded separately from fftw.org, unpacked, configured and installed (see the README and the INSTALL files in the 'fftw-3xx' directory).

Download the latest version of quisk from the homepage of James Ahlstrom (ask Google for quisk, first entry in the search results).

Unpack quisk in your home directory, do a 'cd' into the resulting quisk directory.

Second, your '.quisk_config.py" file is totally wrong for the rx_tx_ensemble. From the quisk directory, do a 'cd' into the 'softrock' subdirectory. There you will find a smple file 'conf_rx_tx_ensemble.py'. Copy it into your home directory as the '.quisk_config.py'. Dont forget the leading '.' and adapt this file only as regards the names of your sound cards.

Then you may go back to he quisk directoy and do a 'make' therein. Start 'python ./quisk.py' You may disregard all ALSA warnings regarding 'Unknown PCM cards'. If annoying, handle that later.

Should you have specific questions regarding any of the above steps, just ask.

73, Rainer DJ6OA

---In n2adr-sdr@yahoogroups.com, <w6jhb@...> wrote :

Sorry to be such a pest/rookie, but I need more assistance. I “think” I successfully did the install of Quisk on my Raspberry Pi 2, and gave it a try this morning. The results were rather disappointing, but at least some progress was seen. Upon startup I got a bazillion errors and warnings, and at this point not where to start. I’ve copied them and they are pasted below. In addition, I’ve included the contents of my quisk-conf.py file, below the error paste. Additionally, once started, Quick was completely unresponsive. No buttons were clickable and the application would not end normally - had to have it killed off. Some initial background data: Radio is a SoftRock Ensemble RXTX, sound card is a Tascam US-125M (external USB-attached). Help on this would be much appreciated!

Topic: 1761 Message: 1761

Well since Jim made some changes (with help) to the audio code (?) ....

I thought i would try again a 96Khz@24bit Via Tech SD-AUD20101 that was 1/4 the size of my current USB sound card ....

I couldnt get it to work with
name_of_sound_capt = "hw:1,0"
or
name_of_sound_capt = "Via Tech"

but

name_of_sound_capt = "pulse" did work.

Is there a way to name the pulse devices i wanted used in the config file ...

Or maybe Sid knows a way to use a script to reorder the devices so that when quisk launches it automatically sets the correct devices for radio I/Q and Mic/Speaker

Also ... can the sound capture device be set for 96Khz while the mic/speaker is 48khz ?

There has never been a quisk problem with any distro's fftw3 libraries
on any architecture, I never had to build them dating back to the
beginning of the Softrock support I collaborated with Jim on.

fftw3 is used by many other SDR applications including ghpsdr3-alex,
rasdr and qsdr as well as other non-SDR applications.
73 ... Sid.

From: Sid Boyce
Topic: 1761 Message: 1763

Mainly for Mike who has delved into these issues many times and has
built and installed a new ODROID kernel to enable snd_aloop the loopback
module for digital modes like wspr and fldigi native apps to be used
with quisk.
Using pulse may be a bit complex for newbies to understand.

If using pulseaudio for devices, e.g
cat /proc/asound/cards
0 [Audio]: Built-in_Audio - Built-in Audio
Built-in Audio
1 [Device]: USB-Audio - USB Sound Device
USB Sound Device at usb-s5p-ehci-3.2.4.4, full speed

fuser -v /dev/snd/*
USER PID ACCESS COMMAND
/dev/snd/controlC1: lancelot 1814 F.... pulseaudio
/dev/snd/pcmC1D0c: lancelot 1814 F...m pulseaudio
/dev/snd/pcmC1D0p: lancelot 1814 F...m pulseaudio
The above shows card 1 being used by pulseaudio, "m" says it's writeable.

In this case I'm only using card 1 for Mic/Speakers.
As in the README, hw:1 or plughw:1 are typical.
Best to keep it simple.
I didn't see any problems in ~/.quisk_conf.py other than the ones I
pointed out earlier and showed how to configure the 2 sound cards.

pactl info

The recent changes to audio were for pulse audio specifically. The changes are transparent from a configuration perspective, but now quisk uses the asynchronous api which helps us manage latency.

The easiest way to use pulse audio is to launch quisk with each device set to "pulse" and use pavucontrol to manipulate which stream cores where. Once setup, the streams will reconnect to the previous device on subsequent launches unless over ridden by the config file. I tested this manually in osx before Jim integrated my changes in 3.7.6, but I will confirm it works with pavucontrol when I get home.

Pulseaudio can use both a default and alternate sampling rate. This is configurable in daemon.conf.

Topic: 1757 Message: 1765

FWIW: I just tried it on my Window 10 - 32 bit OS machine downstairs and it works. So must be 64-bit OS issue.

Got it to run by explicitly stating path to conf file.

1767. Quisk / Raspberry Pi Problems

Yahoo group: n2adr-sdr
Date: 2015-10-29 19:32:51 UTC
From: James Bennett
Topic: 1767 Message: 1767

I've gone back through the install instructions (yes, I had read them before..) and made sure I've installed every other package that is documented. When I do the build of Quisk, I get the error pasted below for a missing file. I'm stumped. By the way - thank you Rainer DJ6OA for pointing out that I was using a bogus configuration. This morning I grabbed the one for Ensemble RX/TX and made a few changes there. The install instructions say that there is a package missing if I get an error regarding a ".h" file So, here is what happens when I attempt to make Quisk:

```
pi@raspberrypi ~/quisk-3.7.7 $ make
python setup.py build_ext --force --inplace
running build_ext
building 'quisk._quisk' extension
gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes -fPIC
-I/usr/include/python2.7 -c quisk.c -o build/temp.linux-armv7l-2.7/quisk.o
gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes -fPIC
-I/usr/include/python2.7 -c sound.c -o build/temp.linux-armv7l-2.7/sound.o
gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes -fPIC
-I/usr/include/python2.7 -c sound_alsa.c -o build/temp.linux-armv7l-2.7/sound_alsa.o
gcc -pthread -fno-strict-aliasing -DNDEBUG -g -fwrapv -O2 -Wall -Wstrict-prototypes -fPIC
-I/usr/include/python2.7 -c sound_portaudio.c -o
build/temp.linux-armv7l-2.7/sound_portaudio.o

-I/usr/include/python2.7 -c sound_pulseaudio.c -o
build/temp.linux-armv7l-2.7/sound_pulseaudio.o
sound_pulseaudio.c:40:30: fatal error: pulse/pulseaudio.h: No such file or directory
compilation terminated.
error: command 'gcc' failed with exit status 1
makefile:3: recipe for target 'all' failed
make: *** [all] Error 1
```

Topic: 1757 Message: 1768

Still tilting windmills. Newest issue is the following Quisk message in the Status window: "No permission to access the Softrock USB interface." Quisk runs fine under Linux. Under Windows 10 I can run the Mobo/Widget rig (the one I am working with) using Powersdr 2.4.4 and Christos drivers. But no joy with Quisk. I've tried a few suggestions I found on the web but nothing seems to help. I know this issue is easily fixed in Linux but I don't know a solution in Windows 10. Anyone had and solved this issue?

Thanks,
73
Jack (W0FNQ)

Topic: 1757 Message: 1772

when you plug the sdr in ..... do you hear the normal successful USB device enabled sound ? does W10 even do that ?

look in the device manager and see if it was installed properly ...

a good place to ask would also be here ...

Mike,
Thanks for the suggestion. I had installed the certificate and I just went into the control console and it is indeed there. I may try reinstalling the drivers tomorrow to see it that makes a difference; although PowerSDR has no trouble with the driver installation.73,Jack

Sid - yep, it is there. The error was caused by my not copying the configure file to my home directory. I did that and Quisk started up somewhat properly. However, I am getting an error on the bottom of the screen about not having permission for the USB stuff. I'm not at home at the moment; will look into that when I get back in an hour or so. But the very good news is that Quick now fires up and the buttons are clickable!!!

OK - back from picking up my son at school.

After Quisk starts up and I have the configuration screen and it’s five tabs in front of me. I’m able to click various tabs but there is no data to be seen. And I’m sure it is because of this error posted on the bottom line:

No permission to access the SoftRock USB interface

I’m sure I’ve got something messed up - where to look to resolve this?

Sid,
pactl info

does not show all of my sink/sources .... it only shows the internal i think

today i tried to use the names shown on quisk's config/sound tab ...
No luck ... but now just using "pulse"is no longer working .... seems like too much delay

bugs a guy when its kinda working one day and the next just refuses to ...

1777. RE: [n2adr-sdr] Quisk / Raspberry Pi Problems

Yahoo group: n2adr-sdr
Date: 2015-10-29 23:43:17 UTC
From: MIKE DURKIN
Topic: 1767 Message: 1777

USB Control
Many radio devices are now controlled through a USB interface. In
many cases, the interface is actually a serial port, and an external or
internal USB to serial converter is used. In other cases, the USB
is native, but requires a custom device driver. In still other
cases, the USB device announces itself as a standard device such as a
sound device or human interface device, and uses a standard operating
system built-in driver.

Linux
Default USB permissions do not allow a non-root user to write to the
bus. You may find that Quisk will complain about lack of
permission to access the USB. You could test this by running
Quisk as root and seeing if that works; but this is not acceptable
except for testing. To change USB permissions, add a rule to
/etc/udev/rules.d/local.rules (for SoftRock on Debian and Ubuntu) like
this:

SUBSYSTEM=="usb", ATTR{idVendor}=="16c0" ,
ATTR{idProduct}=="05dc", MODE="0666", GROUP="dialout"

This changes the USB device permissions to read/write for all users,
and changes the group to the "dialout" group. Default group
permissions are read/write, so if you are in the "dialout" group, you
don't need "MODE"; modify as appropriate. To load the new rule, you can either reboot or on
Ubuntu use

sudo udevadm control --reload-rules

from

http://james.ahlstrom.name/quisk/docs.html#USBControl

Did you see this yet?

> Default USB permissions do not allow a non-root user to write to the bus. You may find that Quisk will complain about lack of permission to access the USB. You could test this by running Quisk as root and seeing if that works; but this is not acceptable except for testing. To change USB permissions, add a rule to /etc/udev/rules.d/local.rules (for SoftRock on Debian and Ubuntu) like this:
>
> SUBSYSTEM=="usb", ATTR{idVendor}=="16c0" , ATTR{idProduct}=="05dc", MODE="0666", GROUP="dialout"
>
> This changes the USB device permissions to read/write for all users, and changes the group to the "dialout" group. Default group permissions are read/write, so if you are in the "dialout" group, you don't need "MODE"; modify as appropriate. To load the new rule, you can either reboot or on Ubuntu use

From: rainerfeldkamp@...
Topic: 1761 Message: 1779

Mike, Linux bugs in this way only those guys who were too lazy to change the last line of /etc/modprobe.d/alsa-base-conf to:

'options snd-usb-audio index = 3, 4'

By doing so, and assuming you have only one usb sound card, it is always card 3 (and does not continuously change on reboot).

Internal card then will always be card 0 and loopback will remain card 1.

Further, in contrast to your goodselfes, the Via Tech SD-AUD20101 has, if its documentation is correct, only a mono Mike sound input and therefore cannot be used for 'name_of_sound_capt', but only for 'microphone_name'.

73, Rainer

"ls -l /dev/softrock" to check the device is created.
grep dialout /etc/group
dialout:x:20:odroid,lancelot

It could be that your user is not a member of the dialout group. I'll have to amend my README_G3VBV.txt I have sent to some users with all the pre-req packages and config options.
"nano /etc/group"
Add your user, e.g
dialout:x:20:pi
73 ... Sid.

1781. RE: [n2adr-sdr] Via Tech sound

Yahoo group: n2adr-sdr
Date: 2015-10-30 01:41:23 UTC
From: MIKE DURKIN
Topic: 1761 Message: 1781

Never heard of 'options snd-usb-audio index = 3, 4'

though i have 2 usb soundcards as well as the internal and loopback ......

Its been found else where that the Syba Via Tech SD-AUD20101 does have stereo input ....

tested on other sites like http://www.telepostinc.com/soundcards.html

and if you read the discription of
http://www.sybausa.com/index.php?route=product/product&product_id=694&search=AUD20101

that it has 2 DAC as well as 2 ADC .... there might be some that were made with a mono jack ... but the one i have does not ... it is stereo and i can do image rejection in the I/Q control tab.

1782. Re: [n2adr-sdr] Via Tech sound

Yahoo group: n2adr-sdr
Date: 2015-10-30 02:23:14 UTC
From: Sid Boyce
Topic: 1761 Message: 1782

Seems only to show the default card which in my case is card 1 on ODROID-U3.

Is pulseaudio running? If so is it showing "m" against the entries in
"fuser -v /dev/snd/*"?
fuser -v /dev/snd/*
USER PID ACCESS COMMAND
/dev/snd/controlC1: lancelot 1814 F.... pulseaudio
/dev/snd/pcmC1D0c: lancelot 1814 F...m pulseaudio
/dev/snd/pcmC1D0p: lancelot 1814 F...m pulseaudio

I am using quisk with pulse, works and has always worked as user and root.
I only need a sound card for Mic/Speakers with the HiQSDR and the 2
Hermes-Lite.

I must try to see if I can put a RXTX, UHFSDR + SDR-Widget or SR63ng +
Mobo + SDR-Widget in service again.
73 ... Sid.

get one of those Syba SD-AUD20101 (they are still around 10$)

USB 2.0 Full-speed (12Mbps), USB Audio Device Compliant

USB Bus Powered. External Power Not Required

VIA Envy VT1620A Audio Controller
and see if it works with the UHFSDR ....

Im confused as to why it would work one day with just "pulse" and not the next ....

1784. Re: [n2adr-sdr] Quisk / Raspberry Pi Problems

Yahoo group: n2adr-sdr
Date: 2015-10-30 03:22:18 UTC
From: James Bennett
Topic: 1767 Message: 1784

Sid,

After rebooting the RPi, I now get:

USB device not found VendorID 0x16C0 ProductID 0x5DC

This on the Quisk bottom / status line. Does this indicate that my Tascam US-125M needs a different code than what I entered per your notes? Were those notes specific to the USB sound card you are using?

When I do the cat /proc/asound/cards, I see my Tascam as:

1 [CODEC] : USB-Audio - USB Audio CODEC
Burr-Brown from TI USB Audio Codec at usb-bcm2708_usb-1.4.2, full speed

Jim

Your confusing the USB soundcard with the USB Si570 controller on the ensemble ...

in a terminal with the soundcard not pluged in or the ensemble ...

type

lsusb

then plug in one of the devices, type lsusb again and see what was added .. you can see the vender ID too ....

1786. RE: [n2adr-sdr] Re: Quisk WIN10 installation

Yahoo group: n2adr-sdr
Date: 2015-10-30 03:47:44 UTC
From: artus1947@...
Topic: 1757 Message: 1786

Mike,

The driver is enumerating correctly; it shows up in the device manger. Further, the Yoyodyne sound card is identified correctly by Quisk. I'll look at posting the other forum.

73,
Jack

1787. Re: [n2adr-sdr] Quisk / Raspberry Pi Problems

From: James Bennett
Topic: 1767 Message: 1787

Mike - very cool - thanks. I did as you said and got the vendorID and productID for the Tascam USB device from the output.

Interestingly, plugging/unplugging the SoftRock RXTX USB cable does not make a change in the lsusb report. I wonder if it is because I have it going through a powered USB hub, and not directly into the RPi?

1788. Re: [n2adr-sdr] Quisk / Raspberry Pi Problems

Yahoo group: n2adr-sdr
Date: 2015-10-30 05:04:42 UTC
From: James Bennett
Topic: 1767 Message: 1788

Sid - see the message I just posted in reply to Mike about the vendorID and productID from the lusb command. In the morning I will place my codes into that rules file and see if that helps.

Also, you said to do a ls -l /dev/softrock. I tried, but that softrock sub-directory does not exist in the /dev folder.

Before I edit that group, can you explain to me what the x:20: is?

1789. RE: [n2adr-sdr] Quisk / Raspberry Pi Problems

Yahoo group: n2adr-sdr
Date: 2015-10-30 05:25:09 UTC
From: MIKE DURKIN
Topic: 1767 Message: 1789

Most likely ....

Try building a seperate power source for the Rx/Tx and do not have the USB device on the softrock powered from the 5V of the USB hub ....

Hubs and powering the softrock from USB power has many times been an issue .....

Try to use the softrock on the RiPi ... and what else thats possible on the hub ....

To: n2adr-sdr@yahoogroups.com

Subject: Re: [n2adr-sdr] Quisk / Raspberry Pi Problems

Mike - very cool - thanks. I did as you said and got the vendorID and productID for the Tascam USB device from the output.

Interestingly, plugging/unplugging the SoftRock RXTX USB cable does not make a change in the lsusb report. I wonder if it is because I have it going through a powered USB hub, and not directly into the RPi?

1790. RE: [n2adr-sdr] Via Tech sound

Yahoo group: n2adr-sdr
Date: 2015-10-30 05:35:14 UTC
From: MIKE DURKIN
Topic: 1761 Message: 1790

Sid, something new to ponder ....

I accidentally left the computer on, not running quisk .....

I came back at least 4 hrs later and ... figured , what the heck ... every one is asleep .. ill try again ....

Changed quisk_conf.py sound devices back to "pulse", saved ....

and launched quisk ... set the devices to their proper source/sink ... and wham ... working ....

So ..... tried adding the correct device names to "pulse:USB Sound Device Blah Blah Blah"

Every thing works ......

Reboot .... and nothing is working again .....

BUT not a clean reboot ..... the first time that teh Odroid came up my DisplayLink was green and stayed that way ... had to power off and boot again (kinda a normal thing sortof -- not often but happens)

after that booted up screen was normal action but now quisk and the soundcards are latent like crazy ....

Im wondering if im having some USB resource issue ....

I disabled quisk from autolaunch apon reboot ....

and rebooted again ... still no joy .....

Now when i came back to the computer when it was on for 4 hours the screen saver was on .... just saying.

Im going to boot the odroid tomarrow and launch quisk after an hour or so .... if it works then ill guess --- well i dont know.... but finding ways that it does work in a regular basis is about the only way to figure why it does not work right after boot like it should.

Kinda wish my HDMI was not blown --- sigh.

Subject: RE: [n2adr-sdr] Via Tech sound

get one of those Syba SD-AUD20101 (they are still around 10$)

USB 2.0 Full-speed (12Mbps), USB Audio Device Compliant

USB Bus Powered. External Power Not Required

VIA Envy VT1620A Audio Controller
and see if it works with the UHFSDR ....

Im confused as to why it would work one day with just "pulse" and not the next ....

W A R N I N G !

The RXTX ensemble was designed for good reason such that the power supply for the ATTiny and the Si570 are galvanically separate from the power supply of the rest of the circuitry, which has to be supplied by 12V via the power jack of the RXTX ensemble. Do not connect any other power supply to the ATTiny and the Si570 portion of the circuit than the USB cable, possibly via an active hub. You might damage your Raspberry. An active hub should not required normally.

Check the voltages across C53 (5V) and C56 (3.3V). If not, check the USB connection and power supply of the active hub, if any

If these voltages are correct, check the file /etc/udev/rules.d/99-softrock.rules by letter, commas and spaces whether this file is identical to the file indicated in the 'Documentation for Quisk'. udev is not forgiving for any mistake in this file.

Alternatively, try to start quisk as root.

73, Rainer

Hi Gena,

yes, the split function works fine. There is currently just a problem with the RIT function in split mode. In Split mode the RIT is just active for the auxiliary RX (green line). Jim already knows that. Since in SSB you usually do not need the RIT you do not notice it. For CW the RIT is used to make the CW tone in RX. Therefore you do not hear CW signals on the main (red) RX if you have split enabled. The Split function itself is rather cool because you can listen to two frequencies in between your CQ calls and you can easliy swap main and auxiliary for calling a station you found via the 2nd RX. The lower frequency is always on the left speaker and the upper frequency is on the right speaker. With headphones you immediately hear were you have been called ;)

1795. Re: [n2adr-sdr] Quisk / Raspberry Pi Problems

Yahoo group: n2adr-sdr
Date: 2015-10-30 17:10:31 UTC
From: James Bennett
Topic: 1767 Message: 1795

All - moving the Ensemble RXTX USB cable off of the USB hub and directly into the Raspberry Pi resolved the issue of the RPi not being seen in the lsusb output.

What the current situation is: Quick starts up, but I am still getting the “No permission to access the SoftRock USB interface” message at the bottom of the Quisk screen. I have verified that my userID (pi) is in /etc/group - it was already there. Suggestions how to get past this one?

Jim

1796. Re: [n2adr-sdr] Quisk / Raspberry Pi Problems

Yahoo group: n2adr-sdr
Date: 2015-10-30 18:05:19 UTC
From: Sid Boyce
Topic: 1767 Message: 1796

Short answer it's put there by the OS at install time.

x - is a placement for a password if needed and the passwords are
supplied by /etc/shadow as a long string of characters, not needed for
the dialout group, 20 is the dialout group designator.

/etc/shadow will look something like this with the passwords encrypted:-
pi:$6x37Gn48BMJ3xYotdDS9xzY:16207:0:99999:7:::
The password is the long string between the first 2 ::
If you forgot the password for a user, you would delete the string so
you get, e.g
pi::16207:0:99999:7:::
Then you can use the passwd command to set up a new password.

OK on the direct connection to the Pi 2 USB.
The Pi B has a limitation on the number of USB devices which it could
drive. Using a Pi B and the powered hub, attaching a keyboard, mouse and
an outboard audio box killed USB.

I had no trouble powering my HiQSDR Audio dongle, touch for the
touchscreen and a Ethernet dongle from a powered hub using the model B,
swapping it out for the Pi 2 it drives the extra devices without crashing.

The +5V to the hub provided by +13.8V --> 3A DC/DC convertor off Ebay.
+6.5V to the HiQSDR also powered by another 3A DC/DC convertor.
73 ... Sid.

1797. RE: [n2adr-sdr] Via Tech sound

Yahoo group: n2adr-sdr
Date: 2015-10-30 18:18:28 UTC
From: MIKE DURKIN
Topic: 1761 Message: 1797

And more now ....

I can reliably use the new Via sound card ...

If when ...

Via is unpluged when booting, once done plug in .....

then before quisk is ran, pavucontrol launched, then quisk ....

When done in this order i can launch quisk with "pulse:USB Audio Blah Blah" in the config ...

Its nice having hte 24bit sound source .... but im not sure im willing to go through all that ....

I probably should look to getting a C1 and remove the Odroid-x2

Subject: RE: [n2adr-sdr] Via Tech sound

Sid, something new to ponder ....

I accidentally left the computer on, not running quisk .....

I came back at least 4 hrs later and ... figured , what the heck ... every one is asleep .. ill try again ....

Changed quisk_conf.py sound devices back to "pulse", saved ....

and launched quisk ... set the devices to their proper source/sink ... and wham ... working ....

So ..... tried adding the correct device names to "pulse:USB Sound Device Blah Blah Blah"

Every thing works ......

Reboot .... and nothing is working again .....

BUT not a clean reboot ..... the first time that teh Odroid came up my DisplayLink was green and stayed that way ... had to power off and boot again (kinda a normal thing sortof -- not often but happens)

after that booted up screen was normal action but now quisk and the soundcards are latent like crazy ....

Im wondering if im having some USB resource issue ....

I disabled quisk from autolaunch apon reboot ....

and rebooted again ... still no joy .....

Now when i came back to the computer when it was on for 4 hours the screen saver was on .... just saying.

Im going to boot the odroid tomarrow and launch quisk after an hour or so .... if it works then ill guess --- well i dont know.... but finding ways that it does work in a regular basis is about the only way to figure why it does not work right after boot like it should.

Kinda wish my HDMI was not blown --- sigh.

Subject: RE: [n2adr-sdr] Via Tech sound

get one of those Syba SD-AUD20101 (they are still around 10$)

USB 2.0 Full-speed (12Mbps), USB Audio Device Compliant

USB Bus Powered. External Power Not Required

VIA Envy VT1620A Audio Controller
and see if it works with the UHFSDR ....

Im confused as to why it would work one day with just "pulse" and not the next ....

From: James Bennett
Topic: 1767 Message: 1798

Sid - any idea how to resolve that problem with “No permission to access the SoftRock USB interface?

Jim

1799. RE: [n2adr-sdr] Quisk / Raspberry Pi Problems

Yahoo group: n2adr-sdr
Date: 2015-10-30 18:50:13 UTC
From: MIKE DURKIN
Topic: 1767 Message: 1799

If your not getting a device change listing with lsusb .... your not going to solve the “No permission to access the SoftRock USB interface"

The Pi still thinks it does not have a softrock pluged in ....

you need to solve the reason the USB system is not picking up the pluged in softrock ....

once the softrock is listed in the lsusb list ....

its device ID should looks something like 16c0:05dc (im going from memory on that)

Subject: Re: [n2adr-sdr] Quisk / Raspberry Pi Problems

Sid - any idea how to resolve that problem with “No permission to access the SoftRock USB interface?

Jim

Using a Pi B and the powered hub, attaching a keyboard, mouse and an outboard audio box killed USB.I had no trouble powering my HiQSDR Audio dongle, touch for the touchscreen and a Ethernet dongle from a powered hub using the model B, swapping it out for the Pi 2 it drives the extra devices without crashing.The +5V to the hub provided by +13.8V --> 3A DC/DC convertor off Ebay.+6.5V to the HiQSDR also powered by another 3A DC/DC convertor.73 ... Sid.On 30/10/15 05:04, James Bennett w6jhb@... [n2adr-sdr] wrote:
Sid - see the message I just posted in reply to Mike about the
vendorID and productID from the lusb command. In the morning I will
place my codes into that rules file and see if that helps.

Also, you said to do a ls -l /dev/softrock. I tried, but that softrock
sub-directory does not exist in the /dev folder.

Before I edit that group, can you explain to me what the x:20: is?

[n2adr-sdr] <n2adr-sdr@yahoogroups.com> wrote:

"ls -l /dev/softrock" to check the device is created.
grep dialout /etc/group
dialout:x:20:odroid,lancelot

It could be that your user is not a member of the dialout group. I'll have to amend my README_G3VBV.txt I have sent to some users with all the pre-req packages and config options.
"nano /etc/group"
Add your user, e.g
dialout:x:20:pi
73 ... Sid.

<mailto:Patriot121@...> [n2adr-sdr] <n2adr-sdr@yahoogroups.com
<mailto:n2adr-sdr@yahoogroups.com>> wrote:

USB Control

Many radio devices are now controlled through a USB interface. In many cases, the interface is actually a serial port, and an external or internal USB to serial converter is used. In other cases, the USB is native, but requires a custom device driver. In still other cases, the USB device announces itself as a standard device such as a sound device or human interface device, and uses a standard operating system built-in driver.

Linux

Default USB permissions do not allow a non-root user to write to the bus. You may find that Quisk will complain about lack of permission to access the USB. You could test this by running Quisk as root and seeing if that works; but this is not acceptable except for testing. To change USB permissions, add a rule to /etc/udev/rules.d/local.rules (for SoftRock on Debian and Ubuntu) like this:

SUBSYSTEM=="usb", ATTR{idVendor}=="16c0" , ATTR{idProduct}=="05dc", MODE="0666", GROUP="dialout"

This changes the USB device permissions to read/write for all users,
and changes the group to the "dialout" group. Default group
permissions are read/write, so if you are in the "dialout" group, you
don't need "MODE"; modify as appropriate. To load the new rule, you
can either reboot or on Ubuntu use

sudo udevadm control --reload-rules

from

http://james.ahlstrom.name/quisk/docs.html#USBControl

Did you see this yet?

Subject: Re: [n2adr-sdr] Quisk / Raspberry Pi Problems

I did some Google searching and came across a couple web hits where
Sid had asked about this very same thing. And, I thought that
additing that 99-softrock.rules resolved the problem?

Jim

Mike - I had resolved that issue earlier today and posted it - by moving the RXTX USB cable directly to the RPi and not via a hub, it now shows up in the lusb report. And if rebooted the RPi several times...

"man 5 passwd" shows the breakdown of the fields plus a good desription.
73 ... Sid.

From: James Bennett
Topic: 1767 Message: 1803

Still cannon get past that USB permission problem. If I start Quisk from within the quisk-3.7.7 directoty by simply entering “python quisk py”, Quisk starts up but I get the “No permission to access the SoftRock USB interface” message on the bottom of the Quisk panel. All the Quisk buttons function properly and I am able to gracefully end the program - just that I’m not having access to something rather important.

The Quisk online documentation sez that if this happens I “should test this by running Quisk as root and seeing if that works.” Since I’m a newbie in the Linux world, I “assume” that I can run it as root by doing an SUDO in front of the above command. Perhaps thats not a good assumption. Very, very different results to be had this way. And I’ll be damned if I know why. When I SUDO startup Quisk, I get a bazillion more error messages (see below) and the Quisk user interface is basically frozen. No buttons work, and the only way to get it ended is to do a Ctrl-C in my terminal session. Ughh…. I did a copy/paste of the two different terminal startup screens and they are below.

I think I’m getting closer to a working application, but I most certainly need an expert’s recommendation on this one.

For information purposes, my userID (pi) is in the dialout group, both my Tascam audio card and the Si570 are shown in the LSUSB report.

Here is what I get with a “normal” startup—>

```
pi@raspberrypi ~/quisk-3.7.7 $ python quisk.py

(python:6085): GLib-GObject-WARNING **: Attempt to add property
GtkSettings::gtk-button-images after class was initialised

(python:6085): GLib-GObject-WARNING **: Attempt to add property
GtkSettings::gtk-scrolled-window-placement after class was initialised

1804. Re: [n2adr-sdr] Quisk / Raspberry Pi Problems

Yahoo group: n2adr-sdr
Date: 2015-10-31 16:56:22 UTC
From: James Bennett
Topic: 1767 Message: 1804

PROBLEM SOLVED!

As I've said before (not completely in jest) "I'm not as dumb as I look." :-)

This morning I did some Google searching on those ALSA messages. It seems that (a) I'm not the only one getting them, and (b) they are mostly "harmless", although annoying and disconcerting.

And then I had my daily brain f@rt - I ran a sudo apt-get update. Bingo - Quisk now starts up (without sudo) and appears to run as expected.

Thank you Sid, Mike, Rainier, and others who've helped me get to this point - very, very much appreciated!

73, Jim / W6JHB

p.s. - I do have a question on Quisk operating / performance, but will start a separate thread on that.

1805. Quisk Audio Question

Yahoo group: n2adr-sdr
Date: 2015-10-31 19:03:10 UTC
From: James Bennett
Topic: 1805 Message: 1805

After several days of trial and error trying to get Quisk operational on my Raspberry Pi 2, this morning I finally had success. Now, I have a question on how to resolve a performance issue on receive.

With the radio sitting on 20 meter CW (for example), I'm hearing and seeing a ton of stations with Quisk in the Graph or Wfall mode. However, the audio seems to be cutting in and out. If I click on the Config button, the audio problem ceases and I can hear the signal I have tuned into perfectly. If I go back to Graph or Wfall, it becomes "choppy" again.

I notice that, on the Config->Status display, the fields in the Device area have some numbers that I believe to be related. There are two lines in particular: "Play radio sound" and "Play microphone sound". Both are showing a "Latency" figure that bounces back and forth between 4600 and 5000. The other column that catches my attention is the "Errors" column for those two devices. With the display of the Status tab on the Config area, they do not change. But, when I change Quisk to either Graph or Wfall, and then come back to the Config display, those two fields have increased significantly.

Another thing I see, maybe or maybe not related is at the top of the Config->Status display. There is a line that says: Cannot open capture device hw:0 (No such file or directory)

At this point I have not yet tried to do the "Adjust receive amplitude and phase" procedure. Would this have anything to do with the choppy audio?

What I find interesting is that the audio is only choppy when Quisk is trying to do two things at once: display the Graph and play the received audio.

Suggestions?

1806. Re: [n2adr-sdr] Quisk Audio Question

From: Eric Thornton
Topic: 1805 Message: 1806

Hello James,

Perhaps you posted your config file in the other thread, but I didn't see it. It sounds like you are using alsa and not pulseaudio? I suspect you are getting latency from cpu maxing out when drawing the waterfall. I have not used a pi2, but I know the pi v. 1B was not up to the task! I'm guessing others have gotten it to work.

At the command propt, type "top" and a screen will come up showing which processes are taking up cpu time. If you see quisk or python taking up 100%, then that is most likely what is happening.

Take a look at the two options below. You can try modifying these values to see if they help. Try increasing the data_poll_usec to something like 20000. That will take some load off alsa. You can also try increasing the latency_millisecs to something like 500 which will buffer more audio on the output and prevent dropouts. I'm using 300/5000 on my setup, but I'm using pulseaudio over a network and the raspberry pi is just acting as a sound server. When I tried to run quisk on my pi (v1B), it took several minutes to open, and then I got bursts of sound about every 10 seconds.

```
latency_millisecs = 300 #was 150
data_poll_usec = 5000 #was 5000
```

Good luck and let us know if this helps.

Topic: 1805 Message: 1807

Hi Eric,

Yes, I am using ALSA, only because it appears to be the default and the only thing I know about Pulseaudio is how to spell it. Anyway, I experimented with a couple of those changes you suggested and if anything, things were worse.

I can tell you that in the little box in the bottom right corner of the RPi 2 there is a CPU % field. This never goes above about 35 or 40 percent. I brought up a terminal session and ran "top". It showed PYTHON as the top user, at around 112%. I'm guessing the processor in this Pi is a multi-core device and that would explain why the number is higher than 100 but not in step with the CPU % box.

At any rate, the percentage of use doesn't change much if I'm displaying the graph, waterfall, or if it is only showing the Config data. So, I'm guessing something else is happening. Note that I used the "G" word there... :-)

Any other ideas what can be done to resolve this?

After several days of trial and error trying to get Quisk operational on my Raspberry Pi 2, this morning I finally had success. Now, I have a question on how to resolve a performance issue on receive.

With the radio sitting on 20 meter CW (for example), I'm hearing and seeing a ton of stations with Quisk in the Graph or Wfall mode. However, the audio seems to be cutting in and out. If I click on the Config button, the audio problem ceases and I can hear the signal I have tuned into perfectly. If I go back to Graph or Wfall, it becomes "choppy" again.

I notice that, on the Config->Status display, the fields in the Device area have some numbers that I believe to be related. There are two lines in particular: "Play radio sound" and "Play microphone sound". Both are showing a "Latency" figure that bounces back and forth between 4600 and 5000. The other column that catches my attention is the "Errors" column for those two devices. With the display of the Status tab on the Config area, they do not change. But, when I change Quisk to either Graph or Wfall, and then come back to the Config display, those two fields have increased significantly.

Another thing I see, maybe or maybe not related is at the top of the Config->Status display. There is a line that says: Cannot open capture device hw:0 (No such file or directory)

At this point I have not yet tried to do the "Adjust receive amplitude and phase" procedure. Would this have anything to do with the choppy audio?

What I find interesting is that the audio is only choppy when Quisk is trying to do two things at once: display the Graph and play the received audio.

Suggestions?

Hi,

question to N2ADR: is there any easy way to use the RIT offset always for the Split RX and the Main RX ? I wonder were to code that into Quisk. I assume in quisk.py somewhere around line 3984 could be the place but i did not yet completely understand the meaning of all the different variables and parameters to the functions. Maybe you have some hint. Otherwise i can also live without the 2nd RX next weekend ;)

regards
Mario

1811. Re: replay recorded IQ-Samples into quisk

Yahoo group: n2adr-sdr

From: michael.hartje@...
Topic: 1730 Message: 1811

Thanks for instruction help how to use it to Sid.

When I recorded a "samples File" with the "File record" button, everythings seems to be fine; a wav-file is recorded and written to disk. The filename is known in the config dialog for "record file". I can add samples with more recording.

(BTW I use a softrock derivate (LimaSDR) with pulse audio and 96 kHz radio sample rate.)

I can load this recorded file into audacity. It shows 2 channels and 96 kHz

But, there is a "File Button for play" which is grey all the time -- so I never can replay this recorded samples to my quisk and demonstrate, how to use it.

Any further recommendations are very welcome, how to replay a samples file into quisk.

Thanks in advance

Michael

Topic: 1757 Message: 1812

Jim,

I tried your recommendation but get same message-- "No permission to access the Softrock USB interface."; I used an elevated Command Window. Then I tried reinstalling all the Widget drivers by the following:
Unplugged the Widget
From Elevated Command Prompt: "set devmgr_show_nonpresent_devices=1"
From Elevated Command Prompt: devmgmt.msc
Showed hidden devices
Removed all traces of anything related to the Widget control or sound
From Elevated Command Prompt: installed "SDRWDGT-USB-Driver-1.2.2.0"
From Elevated Command Prompt: installed "AUDWDGT-USB-Driver-1.2.2.0"
I had previously installed the Amateur Radio Certificate as describe by Fred Kron.

At this point, device enumerates with chime and shows up as soundcard and USB control. I can run PowerSDR 2.4.4 and USB controls work as well as the IQ and audio sound channels. I have tried both Quisk versions 2.7.6 and 2.7.7 with same results. I am running UAC1 mode on the soundcard. Quisk does recognize the sound device. It is apparently not happy with the USB control. This is a Windows 10-64 bit installation.

I can run Quisk on my linux installation without any problems. At this point, I am ready to write off this issue as a "Windows 10" driver glitch and move on to other projects. In particular, I hope to get a viable Linux install working on the new STM32F746g discovery board, then see if I can make Quisk work there. But, thats a piece down the road. I am also gathering parts for a Hermes Lite and anticipate using Quisk then.

I appreciate the great program you have contributed to the community.

Thanks and 73
Jack (W0FNQ)

Tried reducing the sample rate to 24 KHz and Quisk wouldn't do anything. Seems like I'm locked into using 48.

So I guess my big question for the group is: has ANYONE been successful running Quisk on a Raspberry Pi???? I can load a copy of Ubuntu Linux on my iMac and run it there, but I sure was hoping I could press this nice little RPi 2 into service.

From: Sid Boyce
Topic: 1805 Message: 1815

Using HiQSDR with Pi model B and Pi 2, i.e just one USB sound dongle for Mic/Speakers and I-Q via Ethernet I have had no sound dropout problems.

I don't know if sound card I-Q would likely be the cause of dropouts.

This evening I'll try 384K/960K samplerate on the Pi2, think I am using 192K on the Pi 2.

The previous setup with HiQSDR and ODROID-X dropouts occurred and Jim suggested the problem was the CPU also having the additional task of processing video.
Installing the Mali-400 driver to replace the standard GL libraries cured the dropouts.
73 ... Sid.

Audacity is supposed to play up to 192K sample rate - never tried it.

One alternative suggestion, use gtk-recordmydesktop to produce a video
which can be played locally or uploaded to Youtube.

Topic: 1805 Message: 1817

Sid,

Not sure either, but this Tascam unit had been in use for months on my Elecraft K3 doing JT modes and PSK31, so I know it works. Just seems strange that this multi-processor RPi can't handle one application, albeit a heavy one.

From: MIKE DURKIN
Topic: 1805 Message: 1818

how about his ... and i dont know if it is possible yet ....

i think you can send I/Q processed data to another computer with quisk running as well ....

im thinking ..
try taking the video load off of the Pi as a test ... via the network .... and if you can do that,,, then change the bandwidth and bit depth .... if the card works taht way .. then its not a USB bandwidth issue but a processor (or GPU driver) issue ...

Im thinking that if Quisk can do remote like that for Rx/Tx .... ill be able to put My UHFSDR up on my tower (like i wanted to do -- many days ago with ghhpsdr3-alex)

Im close to having my SDR on all bands below 33cm ...and one think i will need is the SDR at the antennas for Microwave bands ... 150' is just to far to send 10W of 900Mhz or even 10Ghz down through ...

Thanks, Sid, for the quick reply.

Ok, your proposal is a good idea and work around. But this is not what I want.

Did I understood you right: there is no internal way to replay the recorded IQ-Samples to quisk?

But: what is the "play File-(IQ)" for? When does it become active? can I configure it for that activation?

Any help is welcome - thanks

I think I ran into the same issue recently.

My workaround was to record the IQ file and playback using "pacat" to my speaker device. I then used pavucontrol to redirect quick input to the monitor stream of my output.

My play button is currently greyed out.

I copied the file quisk.wav from the ODROID-U3 to a x86_64 box, pacat
plays it a very fast speed irrespective of the --rate= 48K, 96K or 192K
"paplay quisk.wav" works fine as does alsa "aplay quisk.wav".

aplay quisk.wav
Playing WAVE 'quisk.wav' : Signed 16 bit Little Endian, Rate 48000 Hz, Mono
73 ... Sid.

1823. audio latency with digital modes - stuttering audio

Yahoo group: n2adr-sdr
Date: 2015-11-02 08:10:37 UTC
From: michael.hartje@...
Topic: 1823 Message: 1823
Attachments: 2 described; binary payloads are missing from this source WARC

hello list,

quisk is used for 96 kS/s IQ-audio device (softrock derivate LimaSDR). I use V3.7.7 and pulseaudio. I checked ALSA only for the IQ-Sound card with similar results.
for the digital modes I tried pulseaudio-devices and aloop. The figure below are with pulseaudio devices for the coupling of fldigi (or wsjtx) with quisk.

In mode SSB (USB/LSB) the latency is normal and no stuttering audio. (see screen: mode-usb)

In modes DGT-U (and others) the latency jumps dramatically up and increases still further. By this, the audio is stuttering and Errors are increasing every few 100 ms.

The parameters
latency_millisecs = 150 # was 150
data_poll_usec = 5000 # was 5000
were chanced in a wide range from a few milisecs to 500 ms -- but no general change with stuttering audio (faster and with 2 ms AM modulated with rectangular audio switch on and off)

Questions:
does anybody have the same problems in combination with external digital mode programs?
What should I look for?
What are the rules for the "latency_millisecs and data_poll_usec?
Why is the stuttering only combined with DIGT-modes in quisk? -- how can I avoid that?
What parameters should I respect in fldigi (pulseaudio is used, I checked portaudio)

Any help is very welcome.

Thanks
vy73

Topic: 1730 Message: 1824

Thanks for these helpful information -- ok; so there seems to be only an external solution with paplay and redirect it into quisk IQ-Input instead of the "normal IQ-source".

The unanswered question is: what is the button "File play" for and when is it becoming active?
May be, that those guys, who have looked a little deeper into the code can add an answer on this...

Thanks for now

Hi Michael,

This option is for playing back the IQ recording over air i think.
I never really tried it but i can probably do this evening if its helpful.

Michael,

I'm doing nearly the same thing and not having issues, and since I'm probably most familiar with the pulse audio code, I'll be glad to help.

Have you built quisk from source? If so, edit the sound_pulseaudio.c file so that line 43 reads "int verbose = 1" and then recompile. Then run quisk. If a device is misbehaving this will help run it down.

What computer is quisk running on? Can you post your config for completeness? Can you post your pulseaudio daemon.conf also.

From: jahlstr@...
Topic: 1730 Message: 1827

There is no one-button feature to play a samples file and have Quisk treat it as radio samples. I guess I will have to add the feature.

Meanwhile you can try playing the file to a sound device and use Quisk digital input to read the same sound device.

1828. Re: Re[2]: [n2adr-sdr] split in quisk

Yahoo group: n2adr-sdr
Date: 2015-11-02 15:47:47 UTC
From: jahlstr@...
Topic: 1681 Message: 1828

Hello Mario,

To fix the RIT so it works on both channels you need to change quisk.c at line 2014:

```
else if (split_rxtx) { // Demodulate a second channel
phase = cexp((I * -2.0 * M_PI * (quisk_tx_tune_freq + rit_freq)) /
quisk_sound_state.sample_rate);
// Tune the second channel to frequency
```

The " + rit_freq" is the change. Then you need to run "make" to recompile.

Michael,

I have the same problem with latency, but I have it in CW and SSB with a SoftRock Ensemble RXTX. I'm only running at 48KHz with a Tascam US-125M external sound card. Have tried all sorts of combinations of parameter changes, ALSA, Pulseaudio, etc. but no change. I run Quisk 3.7.7 on a Raspberry Pi v2 and is is possible the little computer simply does not have enough power to run Quisk. I plan on trying to install Ubuntu Linux and a day or so on a bigger computer with a lot more power to see if that fixes it. If not, I'll probably sell the Softrock and give up on this project, as the Softrock is completely unusable with this latency.

hello Eric and others,

thanks for reply.

According to your questions, I can add the following information:

top shows the following after some hours running quisk

19228 hartje 20 0 944m 392m 17m R 33.6 35.1 405:07.30 python
18837 hartje 9 -11 221m 15m 13m S 22.4 1.4 259:59.05 pulseaudio
5162 hartje 20 0 354m 26m 6200 R 18.8 2.3 228:04.79 pavucontrol
1389 root 20 0 66992 10m 5320 S 11.9 1.0 132:01.18 Xorg
25156 hartje 20 0 329m 28m 7616 R 9.6 2.6 45:27.78 fldigi

uname -a
Linux X300 3.2.0-88-generic #126-Ubuntu SMP Mon Jul 6 21:35:35 UTC 2015 i686 i686 i386 GNU/Linux
it is linux Mint on a Dell X300 Laptop (1.1 GB Ram)

RELEASE=13
CODENAME=maya
EDITION="MATE 32-bit"
DESCRIPTION="Linux Mint 13 Maya"
DESKTOP=MATE
TOOLKIT=GTK

pulseaudio --version
1.1

I built quisk "from source" with "make" (no parameters)
Rebuild of quisk-3.7.7 with sound_pulseaudio.c with line 43: int verbose = 2 ---> see results in the debuglog
Rebuild was done: make (in the quisk-3.7.7-directory)

The following was done with the debug log running qusik one time:
1. Start quisk (usbmode)
2. switch to DGT-U with running fldigi
3. switch to USB
4. close quisk

find included the default.pa and daemon.conf

hopefully that will bring us forward....

Thanks to all for reading and thinking about this problem

@Eric,

sorry for the last mail -- when I read your mail again, I found the mistakes: verbose=2 not 1
Now you will find the correct version enclosed debug-1-log-pulse.log and the full configuration of quisk conf_lima_pulse.py

hope this helps

Thanks

@Jim
Thanks for information -- so all this will help now

And: I would not stop you, if you set this feature (replay of recorded samples) on the list to do with a low priority and of course when you give some more information, what is the "File >" (play) button planned for and when it will be activated and deactivated...

Thanks for your time spending on this problem

Wow. Yes, something looks to be wrong here. The output device buffer size looks way too small. There also may be some configuration issues on both pulse and quisk.

If your can do me one more favor, and set data_poll_usec = 5000 and latency_millisecs= 300. Make sure that you only have those parameters once (comment out the others). Run quisk again and send me the log file. Also, while quisk is running, please run the command "pactl list" and send the output. When I get home from work I will dive into it more.

Your version of pulseaudio is very old, and that may be part of the issue also. I'm not familiar with mint, but ubuntu is up to v3 with v4 as "devel". If there is a newer version available, it would be good to upgrade. I tested down to version 3.

From: jahlstr@...
Topic: 1836 Message: 1836

Foreign users can have trouble with their config directory on Windows because the "Documents" directory is in a foreign language; for example, "Mine Dokumenter". I changed Quisk to use the registry to find the name of the "Documents" directory so Quisk should find it in any language.

When playing a CQ loop using the "Transmit sound from WAV file" feature, pressing hardware PTT will cancel the play loop.

I added the hardware information to the top of the screen. This is convenient when running multiple instances of Quisk with multiple hardwares. I removed the SoftRock status line at the bottom of the screen. The same information is in the Config/Config screen and in the title line at the top.

When operating in Split mode, the RIT control used to only change the Rx channel. But that meant that the other Tx channel did not have RIT. So in CW mode, a station exactly on the Tx frequency would not be heard. RIT now works on both channels in Split mode.

The "Record Rx audio" feature now records Tx audio too. This is useful to record and review a QSO.

Hello Michael and list,

Looking at your pulse daemon.conf i see the lines

```
; default-sample-rate = 44100
default-sample-rate = 96000
default-sample-rate = 48000
#alternate-sample-rate = 96000
```

I am wondering if you tried

```
default-sample-rate = 48000
alternate-sample-rate = 96000
```

Also are you using a wifi connection? In my case Quisk runs perfectly on my little netbook and always has if I use a hardwired ethernet connection but stutters on the wifi connection. My good laptop does the same.

The file play button is used to play a CQ loop, for example, for a contest. It is activated when you specify a "Transmit sound from WAV" file on Config/Config.

From: michael.hartje@...
Topic: 1823 Message: 1839

hello Graeme,

thanks for the info;
In my daemon.conf the line alternate-sample-rate does not work with my (old) pulseaudio -- this line results into an error: so I commented it out.
The last line "default-sample-rate=48k" is active
(But I can activate the line above by commenting out this line 48k) So pulse is working with 96 k.

My screen shots with the early mail are done with direct connected "softrock-(limaSDR)" to the Dell laptop running quisk. -- resulting the issues.

But I made some experiments with network pulseaudio and usbsoftrock daemon too. More or less, this works even when the laptop has a wifi connection. (with usbmode)
(This divided system will be a goal of all these activities: Softrock - Cubieboard - network - computer with quisk and fldigi at a comfortable room in the house or outside.
This concept seems to work well, as many other om's reported here.

But up to now, we are at the first steps, since the combination of pulseaudio with fldigi has the written difficulties at the moment.

Hope, this answers your intentions and hints

1840. Quist 3.7.6 Audio Problem, Part II

Yahoo group: n2adr-sdr
Date: 2015-11-03 00:24:53 UTC
From: w6jhb@...
Topic: 1840 Message: 1840

You may have seen several posts by me in the last week or so asking for help resolving a major latency issue using my SoftRock Ensemble RXTX on a Raspberry Pi v2. I was never successful getting it working.

Today I built a Ubuntu Linux distribution on my iMac under VMware Fusion 8.0.2, downloaded all the required co-packages, along with Quist 3.7.6. I successfully built the Quist module and started Quist. I wish I could report that it was 100% successful. There is still latency, not as bad as on the little Raspberry Pi, but still there, and enough that copying CW is just about impossible. Interestingly, when I ran this on the RPi, the latency was 100% gone if I clicked on the Config tab in Quist. On the iMac, the latency does not go away when the Config screen is shown.

So, maybe I simply have something set wrong in my config file. If someone could take a look at my settings ad let me know if there is something set incorrectly, that would really help. I have a Tascam US-125M external USB sound device connected and is assigned hw:1 and the iMac speaker is hw:0.

Here is my config file:

```
# This is configuration file for a SoftRock Rx/Tx Ensemble or
# other SoftRock that has both transmit and receive capability. You need two sound
# cards, a high quality card to capture radio samples and play microphone sound; and
# a lower quality card to play radio sound and capture the microphone.

# Modified 2 Nov, 2015 by W6JHB

from softrock import hardware_usb as quisk_hardware
from softrock import widgets_tx as quisk_widgets

# In Linux, ALSA soundcards have these names. The "hw" devices are the raw
# hardware devices, and should be used for soundcard capture.
#name_of_sound_capt = "hw:0"
#name_of_sound_capt = "hw:1"
#name_of_sound_capt = "plughw"
#name_of_sound_capt = "plughw:1"
#name_of_sound_capt = "default"

# Pulseaudio support added by Philip G. Lee. Many thanks!
# For PulseAudio support, use the name "pulse" and connect the streams
# to your hardware devices using a program like pavucontrol
#name_of_sound_capt = "pulse"

softrock_model = "RxTxEnsemble"
si570_direct_control = True
si570_xtal_frequency = 14444263
si570_i2c_address = 0x70
```

```
# If you have a SoftRock with a key jack, and you want to monitor the hardware key state
for
# CW operation, enter a key poll time in milliseconds and a semi-break-in hang time in
seconds.
# Do not press the PTT button. CW has its own timer to control transmit.
key_poll_msec = 5
key_hang_time = 0.7

# Radio samples and audio:
sample_rate = 48000 # ADC hardware sample rate
name_of_sound_capt = "hw:1" # Name of soundcard capture device for radio samples.
playback_rate = 48000 # radio sound playback rate
name_of_sound_play = "hw:0" # Name of soundcard playback device for radio audio. Must be 48
ksps.

# Microphone:
microphone_name = name_of_sound_capt # Name of microphone capture device
name_of_mic_play = name_of_sound_capt # Name of play device if CW or mic I/Q is sent to a
sound card
mic_playback_rate = 48000 # Playback rate for microphone
#mic_out_volume = 0.6 # Transmit sound output volume (after all processing) as a fraction
0.0 to 1.0

repeater_delay = 0.25 # delay for changing repeater frequency in seconds
```

Are data_poll_usec and latency_milliseconds left at default values? I
don't see anything else that catches my attention in your config file.

Ubuntu uses Pulseaudio by default. Did you disable the pulseaudio daemon?
Otherwise pulse audio will "capture" the alsa streams and pipe them through
the sound server. If it's running, edit /etc/pulse/client.conf and change
the line that reads "; autospawn = yes" to "autospawn = no". Be sure to
remove the comment semi-colon. Then "pulseaudio -k" to kill the server
(note, don't use sudo on that last one as it's run by the user).

Try starting small with just the capture device and one playback device.
Check cpu usage with top. See if you can figure out where things go south.
If total CPU usage stays 70% or less while running, then we should be good
and we can move on from there. If you are near or at 100% (or more if
multiple virtual cores) then the virtual machine is struggling to keep up.

I tried running quisk under Ubuntu with virtual box, and ran into
performance issues that I was unable to resolve. VMWare may be a better
virtual machine program, but I don't have experience with it.

I need to get a RPi v2 to test. Unfortunately I know my wolfson card will
not work as the pinouts are different.

Thanks,

Eric

1842. Re: [n2adr-sdr] audio latency with digital modes - stuttering audio

Yahoo group: n2adr-sdr
Date: 2015-11-03 04:00:38 UTC
From: Eric Thornton
Topic: 1823 Message: 1842

OK, good news and bad news...

Good news is that I have recreated the issue on an older Ubuntu laptop I have by using all 6 streams, similar to Michael. Things are good until switching to digital mode and then capture sample latency goes up and up and up but I don't get any stuttering after the switch.

Bad news is, this looks like something I missed when testing the new pulseaudio code. Writing to multiple streams causes ever increasing latency on IQ samples.

I will look at this and see what the options are to fix it. It may only affect slower computers (like the X300, this E1505 laptop, and the pi2). I'm using it in a half duplex mode (enabled automatically when using a network server) so I didn't see this.

As soon as I have a fix I'll send a patch.

Thanks,

Eric

Michael,

This is 100% reproducible for me with pavucontrol open. Without, I maintain normal latency even when in digital mode. Do you have a pavucontrol process running?

Thanks,

Eric

Eric,

Got it going!!!! I did not realize that Ubuntu kept Pulseaudio as the default. I changed my config to have the name_of_sound_play = "pulse" and that took care of the problem. I do want to note that I probably was not naming my issue correctly. Rather than "latency" I think it more accurate to say "choppy audio" was what I was getting. Now it sounds great. There is some actual "latency" though - when I key my Elecraft K3 there is a small time gap between the key closure and when I hear the audio coming from Quisk. It is enough of a gap to screw up your brain when trying to send CW!

You had asked if I changed data_poll_usec and latency_milliseconds. No, I have not. Will modifying them help that actual latency issue? Suggestions on changes?

And now I wonder if the RPi v2 was doing a default to Pulseaudio like Ubuntu. I hate to re-cable everything again, but in the morning I want to move the RXTX and sound card back to the RPi with the Pulseaudio change that I did tonight in Ubuntu. That would be excellent if the RPi worked and I don't have to mess with the iMac.

Again, thanks for the info regarding Pulseaudio!

You can also call out the device name with pulse too .....

getting the correct name might be tough .. but i think that the config/sound tab has the correct names

name_of_sound_play = "pulse:USB Audio Device Blah Blah"

I recently did this and also had to(for some reason) auto launch pavucontrol before quisk ... i have extra heavy load on my USB bus due to a DisplayLink display (iv got a blown HDMI -- sucks) and iv probably just about maxed my system out ....

Jim,

Glad to help. I know pulseaudio is available in raspian (pi os) but I'm not sure it was installed on the default image a year ago.

As for latency, two main things affect it... If quisk or pulseaudio lags, samples build up in the read buffer. There is also a playback buffer that is normally configured to the latency_milliseconds value. So a value of 150 is 0.15s. There is also sound card frame buffering that adds some overhead too.

When you go to the status page using the config button, are the values stable? The read samples should stay low around 10,000 to 20,000 ish. The playback buffer should float around your latency value x 1000. I'm working on an issue now that causes these values to climb unacceptably when in digital mode.

Eric,

I'm looking at that display right now. The Latency value for "Capture radio samples" jumps between 0, 48, and 96. Occasionally I see a 144 in there. The Latency value for "Play radio sound" is around 130,000 or so. The "Play microphone sound Latency is hovering around 5,300.

Not sure which, if any, of those data figures are what you meant, as there are none labeled "read samples". Sorry if I'm a bit slow on the uptake here - this SDR stuff is pretty new to me!

What parameters should I try changing to eliminate the lag in the audio?

Jim

I successfully built the Quist module and started Quist. I wish I could report that it was 100% successful. There is still latency, not as bad as on the little Raspberry Pi, but still there, and enough that copying CW is just about impossible. Interestingly, when I ran this on the RPi, the latency was 100% gone if I clicked on the Config tab in Quist. On the iMac, the latency does not go away when the Config screen is shown.

1848. Pulse and loopbacks

Yahoo group: n2adr-sdr
Date: 2015-11-03 07:20:12 UTC
From: gvjury@...
Topic: 1848 Message: 1848

Hi group,

I guess this is really aimed at Eric and Jim but I am still having a few issues with pulse although alsa is working well. Then stay with alsa you may advise but there is a couple of strong reasons to move.

For some unexplainable reason pulse has less latency than alsa and I am running "latency_millisecs = 25" with no problems using pulse. The latency really is better and I can key at 25 wpm using the sidetone monitor on quisk rather than the sidetone on the keyer and in fact they sound almost perfectly in sync.

wsjt-x requires pulse rather than alsa as wspr does and I want to switch to wsjtx as it now supports wspr on the devel version.

My .quisk_conf.py file contains the following settings

```
name_of_sound_play = "pulse:hw:0,0"
microphone_name = "pulse:hw:0,0"

digital_input_name = "pulse:hw:1,0"
digital_output_name = "pulse:hw:1,0"
```

The config/status screen on Quisk displays the following ...

```
Capture radio samples UDP
Capture microphone samples pulse:alsa_input.pci-0000_00_05.0.analog-stereo
Capture digital Tx samples pulse:alsa_input.platform-snd_aloop.0.analog-mono
Play radio sound pulse:alsa_output.pci-0000_00_05.0.analog-stereo
Play digital mode sound pulse:alsa_output.platform-snd_aloop.0.analog-mono
```

All the devices show latency moving except "Play digital mode sound" which displays 0 so I have a problem there.

Now here comes the bits I can't get my head around. On the config/sound panel the loopback devices are reported as ...

```
Available devices for capture
Loopback Loopback PCM (hw:1,0)
Loopback Loopback PCM (hw:1,1)
Available devices for playback
Loopback Loopback PCM (hw:1,0)
Loopback Loopback PCM (hw:1,1)
```

but if I try to use digital_input_name = "pulse:hw:1,1" Quisk crashes. I am assuming that loopbacks are arranged something like this ...

```
hw:1,0 ---- Loopback ---- hw:1,1
```

so that a signal fed in on hw:1,0 will appear as an output on hw:1,1. wsjtx can't seem to find hw:1,1 so I was wanting to connect Quisk to hw:1,1 and see if I can get a connection to wsjtx on hw:1,0

It is also interesting that using name_of_sound_play = "pulse:hw:0,0" shows up as Play radio sound pulse:alsa_output.pci-0000_00_05.0.analog-stereo in Quisk.

Jim just a suggestion but it would help a lot if the status, config, sound etc pages in Quisk were text based like the help page as cut and paste from them would be very useful for settings and help.

Again Quisk Quisk 3.7.8 has turned out to give useful improvements and is a delight to use.

Hi Jim,

thank you for implementing all the stuff !
The Split feature in CW is now really cool. You can call CW and listen to other stations in between your CQ loops. Together with the DX Cluster feature you do not miss anything anymore ;)

regards
Mario

Hi Graeme,

I've never tested alsa loopback through pulse. Puleaudio has it's own method of doing this with a null sink. In your /etc/pulse/default.pa add the following line and restart pulse.

load-module module-null-sink sink
_name="digital-out"

Now you can change your quisk config to digital_output_name = "pulse:digital-out" and configure wsjtx to use digital-out.monitor as it's source. The reverse can be done to get audio back to quisk by adding a second null sink named digital-in and configuring quisk to read pulse:digital-in.monitor. This sounds confusing at first but it works well. I am doing this with both fldigi and wsjtx development. Using pulseaudio and alsa together may be resulting in the crash. It's definitely not ideal.

The 0 latency value status screen is because the digital output (and play microphone sound) both have latency reporting nulled out in the code. I need to talk with Jim about enabling these but didn't want to break anything if they were set to 0 for a reason since this change affects all audio interfaces.

Let me know is this resolves your issues. If not, can you post the crash message?

Eric

From: James Bennett
Topic: 1840 Message: 1851

Eric,

Well, I moved the RXTX and sound card back to the RPi this morning and set the name_of_sound_play to “pulse”. No joy. When I started Quisk it pretty much froze up. No reception, none of the buttons were responsive. Changed the config back to hw:0 and it ran, but the choppy audio was back. I gave up and moved it all back to the Ubuntu guest on my iMac/VMware Fusion. Works pretty well over on this platform.

In an attempt to reduce the latency, I’ve gone so far as to set latency_millisecs to 20 and data_poll_usec to 200. It has helped, but not entirely. I do see with things set this way that I have a ton of errors (and climbing) on “Play radio sound”. I think I’ll probably set those two values back closer to default and cut back on the errors. My CW operating will be done using an external K1EL keyer with a built-in side tone, so if I listen to the side tone my brain won’t get messed up.

Anyway, if you do ever get hold of a Raspberry Pi V2 and fiddle with quisk on it, please post or drop me a note (w6jhb@... <mailto:w6jhb@...>) how it works for you.

>
> As for latency, two main things affect it... If quisk or pulseaudio lags, samples build up in the read buffer. There is also a playback buffer that is normally configured to the latency_milliseconds value. So a value of 150 is 0.15s. There is also sound card frame buffering that adds some overhead too.
>
> When you go to the status page using the config button, are the values stable? The read samples should stay low around 10,000 to 20,000 ish. The playback buffer should float around your latency value x 1000. I'm working on an issue now that causes these values to climb unacceptably when in digital mode.

>
> Got it going!!!! I did not realize that Ubuntu kept Pulseaudio as the default. I changed my config to have the name_of_sound_play = "pulse" and that took care of the problem. I do want to note that I probably was not naming my issue correctly. Rather than "latency" I think it more accurate to say "choppy audio" was what I was getting. Now it sounds great. There is some actual "latency" though - when I key my Elecraft K3 there is a small time gap between the key closure and when I hear the audio coming from Quisk. It is enough of a gap to screw up your brain when trying to send CW!
>
> You had asked if I changed data_poll_usec and latency_milliseconds. No, I have not. Will modifying them help that actual latency issue? Suggestions on changes?
>
> And now I wonder if the RPi v2 was doing a default to Pulseaudio like Ubuntu. I hate to re-cable everything again, but in the morning I want to move the RXTX and sound card back to the RPi with the Pulseaudio change that I did tonight in Ubuntu. That would be excellent if the RPi worked and I don't have to mess with the iMac.

I think I remember that the same device is used in Quisk and in the external program. So:

hw:1,0 ---- Loopback ---- hw:1,0

Hello Mario,

Thanks. I am glad this is working. My next project is to re-organize the buttons so that Quisk is more usable on a small screen, such as those connected to Raspberry pi.

After that, I have a project to control config file settings within Quisk so a config file is not needed. This will also support multiple radios for those with several SDR hardwares.

Hi Eric,

Yes this is perfect. I found that the crashes were due to names for audio that Quisk did not understand like when I was trying hw:1,1 which although listed as an "Available devices for capture" was in fact an invalid device. Changing to hw:1,0 fixed that problem. Quisk also crashed when I made silly mistakes like hw:0.0 instead of hw:0,0 it amazing how dumb computers are and they do exactly what you say instead of what you mean.

Thanks for the help Eric, I think you have done an amazing job with pulse and for the first time I have seen the value in it. I must admit I was terribly biased by the excellent results I have had from Jack and QjackControl gave the most wonderful interconnection info but now I can see that you can get the same result from pulse and the latency is very good. When Ubuntu first went with it, it gave me a lot of headaches but it is good now.

From: Graeme Jury
Topic: 1848 Message: 1855

Hello Jim,

Amazing how 1 line of help gives so much understanding. Yes the penny has dropped and I can see how the loopbacks work now and I have implemented my loopback with pulse on my main computer thanks to Eric's help.

It is very strange that I got the alsa loopback that I set up on another machine to be understood by pulse and goes just fine on it but on this machine it did not. The two machines are using Linux Mint 17.2 but are different in that one is 32 bit (works with alsa) and the other (my main machine) is 64 bit. I am thinking that it is a wsjtx problem and will revisit it some time later but I need to get back to the Hermes Lite for now.

The manual probably needs updating to include the pulse info and setting up a loopback for fldigi, wsjt-x etc. but with the reduced panel and stuff you are contemplating it may need quite a big change rather than just pulse. I can see the value in a reduced button panel but also like to have all the controls I use available to click onto rather than drop down menus. maybe a compromise of say 3 tabbed pages with Rx controls on 1 page Tx controls on another and normal operating controls on the third. The Zoom sliders could stay in the same place.

Tnx es 73, Graeme zl2apv

Topic: 1823 Message: 1856
Attachments: 2 described; binary payloads are missing from this source WARC

@Eric,
thanks for th info, that you got the issues as well.

1. Yes a pavucontrol was open to switch and control the streams. When I closed it , the situation becomes better and drop out were reduced but still increasing latency (as you described it as well)

2. For linux Mint Maya 13 ubuntu 12.04 (precise) is a base system. When the Dell X300 has a non PAE-CPU, it is not easy to upgrade to newer ubuntu 14.04 (and getting an actual pulseaudio) -- But I fear, that I should do this.

3 Enclosed you find the log of "pacmd list", while qusik is running in DGT-U mode with 48 k (and pulseaudio also 48 k) and fldigi is connected -- pavucontrol is off.
As you recommended, parameters in quisk are latency_milisecs=300 and data_poll_usecs=5000.
Find enclosed the log of quisk with verbose=1 in sound_pulseaudio.c:43.

Hope this helps to catch it.

Thanks for now

vy 73

Just want to say hi to the group! I have dusted off my Raspberry Pi2

with Mint installed and would like to get Quisk running on it.

Here's what I have done so far - hope it is of interest!

02-11-15 Attempting to install Quisk on Raspberry Pi2.
Trying to follow a thread on Yahoo groups and the instructions at 'What is Quisk'
Had to install gzip.
Installed required libraries.
Downloaded quisk-3.7.7.tar.gz
gunzipped it to get quisk-3.7.7.tar
tar xf quisk-3.7.7.tar

used python quisk.py to run quisk but got this error:

shane@pi-desktop:~/quisk$ python quisk.py
Traceback (most recent call last):
File "quisk.py", line 34, in <module>
import _quisk as QS
ImportError: ./_quisk.so: cannot open shared object file: No such file or directory.
I don't have a clue what this is about!

Wednesday 4th November 2015.
Played about with previous install all morning on and off. Got nowhere so decided to remove the last install 3.7.7.
I had already downloaded all the pre-requisite libraries so with nothing to lose I thought I would try sudo apt-get install quisk from Raspberry Pi2's Mint.
All seemed to download - took quite a while though.
Under applications I now had Quisk. I clicked on it - at first i thought nothing was going to happen (as expected) but blow me after a half a minute Quisk 3.6.18 popped up!
I wasn't ready for that. I scratched around for some old usb sound cards and found one I used on Softrock 9 a few years ago.
I plugged it in but it had to be straight into the Pi2 it didn't get detected via my 4 port usb hub.
Bus 001 Device 011 ID 0d8c:0102 C-Media Electronics, Inc. CM106 Like sound device.
I used the .quisk_conf.py from my other Ubuntu machine which is very simple.

sample_rate = 48000 # ADC hardware sample rate in Hertz
name_of_sound_capt = "hw:1" # Name of souncard capture hardware device.
name_of_sound_play = name_of_sound_capt # Use the same device for play back
channel_i = 0 # Soundcard index of in-phase channel: 0, 1, 2, ...
channel_q = 1 # Soundcard index of quadrature channel: 0, 1, 2, ...

At this point I set the audio defaults and input some cw audio and plugged my headphones into the external usb sound card.
I could hear the output and the waterfall showed me +/- 24 khz (of my 3khz signal!).

Progress.

SDR next - I have a Kanga Soft rock type receiver that I have had working on my other 'big' Ubuntu system.

My ultimate aim is to build a transciever with a Raspberry Pi2 and a small Oled display showing Quisk (optimist!).
The Vfo is an Arduino with a 2 x 16 display - which I've just finished.

Writing this on the Pi2

73's and all comments welcome.

The ~/.quisk_conf.py looks good. You didn't run "make" in quisk-3.7.7
directory.

There are also a number of pre-req packages needed. I submitted some
posts 16th. and 17th. October.
Check the archives.

"sudo apt-get install build-essential" first, the others plus
instructions you'll find in my posts.
If you have problems after that, please ask.

From: MIKE DURKIN
Topic: 1860 Message: 1860

Does any one know what to enter into the soundcard settings for fldigi ?

It has a box where you fill in the serverstring .... just leave it blank?

Im using the loopback for digital ....

so far fldigi keeps saying that the server refused connection ....

From: michael.hartje@...
Topic: 1860 Message: 1861

what system loopback are you using? (OSS, ALSA. PULSEAUDIO)?

A simple path is to use Pulse -- then you can arrange the input and output in "pavucontrol"
If you use alsa (snd-aloop) then you can use "portaudio" and giving the names in fldigi

If you want to use pulseaudio for qusik and fldigi, you should have a look on this website

Leave server string blank, but you need to point it to the sound source using pavucontrol. You can either create a null sink in pulseaudio and use this with digital out, or the easier way is to point fldigi to the monitor of your radio output.

Let me know is this makes sense.

I like to recommend using a really loopback for operation with fldigi. So you can mute the AF-Output. In my opinion the "digital sound" is nothing for listening all the time (snd-system dependend use
alsa: modprobe snd-aloop and the loopback devices is called Loopback,n Pulse: make 2 pulse "null-sink" named L_Rx2app and L_app2TXin. Write into these devces, listen to L_Rx2app.monitor since I sent my pulseaudio config files during the past days to this list, you can find some examples here in the list archives for your adaption (look for my postes the last days) have a look for files named default.pa and (daemon.conf)

hope this helps

yes transmitting -- and in parallel

I open WSJT-X and fldigi -- fldigi controls the TX-Freq, WSJT-X controls the Split-freq for the 2. RX. There you have to use "split" both are in parallel reporting to pskreporter -- see the attached screen shot.

you must configure the fldigi with xmlproc and wsjtx with hamlib- control of quisk. It is a good idea, to have 2 more loopback channels to divide the left and right audio channel into different devices. So we have the right audio at the right programm. -- a simple method is to put both channels to both programs (this works well: have a look to my results the last week on pskreporter)

hope, this helps

From: Eric Thornton
Topic: 1823 Message: 1866

Michael,

I've thoroughly looked over the logs and files and I'm not seeing anything on the configuration side or quisk side that we're doing wrong. On the old laptop that i was able to recreate the problem on, the symptoms only appear when I am running out of CPU capacity. If quisk and pulse audio together stay below say 80%, everything is fine. When the digital mode is enabled, several things start happening... Quisk is now writing two streams of audio output and pulse audio starts to resample that digital output down to 8khz float-32 mono (fldigi's spec).

A couple of workarounds that may help short term.
-You can increase the "default-fragment-size-msec" to something like 80 in /etc/pulse/daemon.conf. This may keep pulse audio load lower, but it may not be enough to help.
-Instead of using digital-output to send samples to fldigi, try using the monitor stream of your normal sound output. This stream is already running, and aside from some differences in the filter shape, it works the same (and with lower latency).

Something still seems amiss why the latency continues to increase when we're reading all the samples that pulse audio has. The only thing I can figure, is that pulse audio is not able to move the samples from the sound card buffer to the application quickly enough for some reason. I'm not giving up on this problem though, but it may be a few days until I can do more testing on potential fixes.

Date: 2015-11-06 05:45:07 UTC
From: Eric Thornton
Topic: 1823 Message: 1867

Michael,

More digging into this issue revealed an improvement on my end that has fixed the increasing latency under my test conditions. Seems when pulse audio is heavily loaded, we were leaving samples on the RX device.

Try deleting line 516 of sound_pulseaudio.c and recompiling. The line in question is "read_frames = dev->read_frames".

Let me know if this works for you. If there are no side effects Jim can change it in the next release.

Thanks,

Eric

Gee Mike,
You continue to amaze me with what you can find and how you push
hardware and software to the limits.
Keep digging.

I don't think I'll live long enough to get to 20 favourites.
73 ... Sid.

Good on you.

My radio/computer room is indoors and in most cases I have to turn the heat off to stop the PC's complaining.

I use the loft for storing unused gear and parts in preference to the garage, fearing corrosion. Not a problem with kit that is left powered on.

Subject: Re: [n2adr-sdr] audio latency with digital modes - stuttering audio

Michael,
More digging into this issue revealed an improvement on my end that has fixed the increasing latency under my test conditions. Seems when pulse audio is heavily loaded, we were leaving samples on the RX device.
Try deleting line 516 of sound_pulseaudio.c and recompiling. The line in question is "read_frames = dev->read_frames".
Let me know if this works for you. If there are no side effects Jim can change it in the next release.
Thanks,
Eric

Michael,
I've thoroughly looked over the logs and files and I'm not seeing anything on the configuration side or quisk side that we're doing wrong. On the old laptop that i was able to recreate the problem on, the symptoms only appear when I am running out of CPU capacity. If quisk and pulse audio together stay below say 80%, everything is fine. When the digital mode is enabled, several things start happening... Quisk is now writing two streams of audio output and pulse audio starts to resample that digital output down to 8khz float-32 mono (fldigi's spec).
A couple of workarounds that may help short term.-You can increase the "default-fragment-size-msec" to something like 80 in /etc/pulse/daemon.conf. This may keep pulse audio load lower, but it may not be enough to help.-Instead of using digital-output to send samples to fldigi, try using the monitor stream of your normal sound output. This stream is already running, and aside from some differences in the filter shape, it works the same (and with lower latency).
Something still seems amiss why the latency continues to increase when we're reading all the samples that pulse audio has. The only thing I can figure, is that pulse audio is not able to move the samples from the sound card buffer to the application quickly enough for some reason. I'm not giving up on this problem though, but it may be a few days until I can do more testing on potential fixes.

I completely agree. Last weekend i participated in the MMC VHF and did 250 QSO with the Hiqsdr and a ME2HTPro transverter using a 2 antenna system. I had a local CW skimmer which gave me spots of what i hear in the current direction (or the omni antenna) into the log. With the 2nd receiver i was able to listen to the frequency given by the cwskimmer in between the CW loops. If the station was heard, stop the cq loop, switch to "rev", do the qso, switch back and start the loop again. Really cool.

The only feature that i would have in mind is the following: It would be good if the tune control commands via Hamlib can be rerouted to the 2nd receiver in case Quisk is in split mode. (so tuning the "green" receiver instead the "red" one) That would enable to select the frequency directly from the spot in the log software despite manual tuning without interfering with the TX frequency.

1876. Remote control (across internet) of HiQSDR with Quisk

Yahoo group: n2adr-sdr
Date: 2015-11-09 20:58:25 UTC
From: peter@...
Topic: 1876 Message: 1876

I've designed a 3 band VHF transceiver, using HiQSDR and Quisk as panadapter on 10.7 MHz. The 10.7 MHz bandwidth is limited to 300 kHz (using Ceramic filters) in order to obtain the best possible dynamic range of the ADC. My intention is to use this transceiver eventually at my remote location, 20 km from where I live: hence using internet. (I presently run my - old - home tranceiver this way, but only audio and control signals need to be transfered). To exchange data to and from a remote location may be done via internet when the available bandwidth is high (> 10 Mbps) and I suppose the ethernet cable between the HiQSDR and Quisk PC (an ODROID U3) could be severed and linked across internet in some way. I one has Bandwidth... In my case I have 1....4 Mbps at best!
So what options are available, if it is possible at all? The first thing that jumped to my mind was:
- "Can the IP (UDP) data be compressed/de-compressed, saving some bandwidth?"
- Alternatively; Would it be possible to send Clever (graphical) data from the ODROID U3 (@ remote) to the Local (controlling) destination? (Delta only?)
- Better still: Someone already has a solution! :-)

Of course, reducing the SDR graphical bandwidth reduces the IP data between the HiQSDR and the ODROID, but I'd have to go to 48 kHz to squeeze it into the available Internet bandwidth that is available.

Any ideas how to tackle this?

73s,

Peter, PA3BIY

1877. Re: [n2adr-sdr] Remote control (across internet) of HiQSDR with Quisk

Yahoo group: n2adr-sdr
Date: 2015-11-09 23:04:03 UTC
From: Sid Boyce
Topic: 1876 Message: 1877

Hi Peter,
There is ghpsdr3-alex http://napan.ca/ghpsdr3/index.php/Main_Page

It needs qt5, you can follow the ODROID section if you decide to build qt5 but qt-52.1 packages are available from the repo for Ubuntu 14.04. Follow the Wiki for building ghpsdr3-alex and configuring pulseaudio, etc.

I run hiqsdr-server and dspserver on the ODROID-U3, also QtRadio on the -U3 or another PC/laptop on the LAN or across the internet from anywhere.

3 components of ghpsdr3-alex are needed for HiQSDR.
First "hiqsdr-server -s 96000 -i 192.168.2.196" or whatever the IP address is. This talks to the HiQSDR.

When you first start the second component "dspserver" to put it on the internet you get a series of commands you must execute. The commands set up files in the current directory. If you launch dspserver from any other directory you have to repeat those commands as it informs you, then restart dspserver. It would be nice if it stored the files always in ~/.

```
------------ CUT ------------
#!/bin/sh
while [1]
do
dspserver --share --lo 0 --nocorrectiq
sleep 5
done
---------- CUT ---
```

The above script keeps dspserver from dying, an old error for which no fix was ever found.

Across the LAN, locally on the ODROID or across the internet QtRadio on a PC or glSDR from google play and you have control.

On the internet it's accessible to anyone using QtRadio or glSDR on an Android phone or tablet.

First connection is master but you can assert Master from those apps if anyone gets on first and is Master. Master can tune, Slaves can only listen to what Master is tuning to.
TX is by ID/password you have to set in ~/dspserver.conf and Server/password in your apps.
I once didn't set them in ~/dspserver.conf for Hermes, when the guy clicked MOX I could hear the RX/TX relay clicking, luckily I did not have the PA powered up so no RF was going out.

Example ~/dspserver.conf

```
# Simple config file for ghpsdr3's dspserver.
# default file is located at ~/dspserver.conf when dsp server is started
with --share
# The information below will be supplied to a web database which will
aid QtRadio
# users find active dspservers to connect to. You may also see the
current list at
# http://napan.ca/qtradio/qtradio.pl
# valid fields are call, location, band, rig and ant
# lines must end with ; and any characters after a # is a comment and
ignored
# field values must be enclosed with " ie: "xxxx"
# This default file will be created if dspserver is started with the
--share option and ~/dspserver.cfg does not exist
# You may also start dspserver with an alternate config file by starting
dspserver with --shareconfig /home/alternate_filename.conf
# Note field names are all lowercase!

call = "G3VBV";
location = "Halesowen, IO82XL";
band = "160M - 6M";
rig = "HiQSDR+Preselector+10W PA";
ant = "Lightning Bolt Quad";
share = "yes"; # Can be yes, no
lookupcountry = "yes"; # Can be yes, no

#### Following are new TX options #####

tx = "password"; #Can be: no, yes, password

#ve9gj = "secretpassword"; #add users/passwords one per line (Remove
leading # ! max 20 characters each
g3vbv = "blx23yn";

groupnames = ["txrules1"]; #add group or rulesset names in ["name1",
"name2"]; format (max 20 characters each

# Add user names in ["call1", "call2"]; format to list members for each
groupname above with an suffix of "_members"
txrules1_members = ["g3vbv"];

# Rule sets are defined as group or rulesset name =( ("mode", StartFreq
in Mhz, End Freq in Mhz),("mode", StartFreq in Mhz, End Freq in Mhz) );
# Valid modes are * SSB, CW, AM, DIG, FM, DRM ,SAM, SPEC Where * means
any mode is OK
# The two rules below allow any mode on 20M and CW only on the bottom
100Khz of 80M
# You can make as many rules and rulesets as you wish. The first
matching rule will allow TX
```

```
txrules1 = (
("*",1.800,2.000),
("*",3.600,3.800),
("*",7.000,7.200),
("*",10.100,10.120),
("*",14.050,14.350),
("*",18.100,18.170),
("*",21.100,21.450),
("*",28.100,28.970),
("*",50.000,55.750)
);
```

You can if you so desire, give TX access to another callsign in txrules1_members and setting an ID and password for that user.

Your router needs at least port 8000 open to where dspserver is running. I open 10 ports, 8000:8004 and 9000:9004 to the IP address of the -U3.

There are Youtube videos showing glSDR and QtRadio.
73 ... Sid.

Hi Sid,

You ARE the expert when it comes to SDR, hi! Many thanks for the extensive answer, I'll dive into it tonight when I get back from QRL. BTW, the designed VHF transceiver is only operational from a large alu plate to hold all the PCB and there are still many things to be done before it is ready to be transported to my remote location. However, that was the reason I want to know now what are my options. Your suggestion sounds very viable!

Best 73s,

Peter

Hi Peter,
SDR has been a labour of love ever since I first discovered Softrock.

I have long written documentation for colleagues along the lines of what to type in rather than shroud it all in tech-speak that sends them off on a hunt in order to complete the task.

OK on the VHF transceiver, obviously a design and test effort before putting it into a nice case straight off only to discover major mods still need to be done.

ghpsdr3-alex is a great solution, it allowed me to demo operation of my HiQSDR using my Android phone from London.
One minor problem, some guys will connect as Master and lock out slaves by sitting it on an AM broadcast station, on an unoccupied frequency or inputting VHF/UHF frequencies when the station description says 160m - 10m and an HF antenna. Could do with a timeout feature.
Of course it is an inconvience to other users who would like to connect and tune the ham bands, no problem for the owner who simply can kick them off by pressing Master.

BTW I replaced the BGA616 on the HiQSDR by putting it on a small piece of PCB with wires to the board as there are signs the board is burnt and the track from the output was lifted. I still need to test for RF output.
73 ... Sid.

Hi Sid,

I've ran some tests with QT5, but it's not what I'm looking for. Quisk provides the functionality I am looking for, at least as an IF for the 3-band VHF transceiver that I designed. Hence I'm looking for a method to transport crucial info (ie: the 300 kHz bandwidth graphical and/or waterfall display) to my home site. Next to that audio (obviously!) info must be transported, although that's not such a huge task. Contrary to many web SDRs, I like to add a tuning knob functionality, like I've done with my present remote control transceiver. Perhaps I'm a bit out of tune with the rest of the web sdr world, as I look for a specific solution in order to reach out to my remote location, but still like to have the "touch and feel" of a desk top transceiver.
Hence, I look for a dedicated solution which may not be invented yet... This solution could be some powerful data compression technique, or smarter: a way to transport the graphical data in a compressed form, and dispaly it again on a TFT locally. My present remote station works without the aid of PCs (although computing power is incorporated in the remote and local units, obviously!).

Perhaps I need to start digging myself into the Quisk (Python) code, and find a way to extract and compress the graphical data, but if you have any suggestions (or anyone else!), those would be greatly appreciated (as I am a newbie in Python).

73s,

Peter

OK Peter,
One feature that's in QtRadio I would like to see in quisk is support
for the Griffin Powermate. It's used as a tuning know and volume control.

The driver is already in the kernel.
73 ... Sid.

Hello Mario,

I put in an option to route Hamlib tuning commands to the second (green line) receiver. But I find Hamlib confusing, and I have no way to test this. So please give it a try when the next release comes out.

1884. digital mode, multiple instances, different hardware

Yahoo group: n2adr-sdr
Date: 2015-11-13 12:24:38 UTC
From: la3jj@...
Topic: 1884 Message: 1884

Hi all, I have had some fun with latest quisk modifying it for my use with digital modes. I have made it play well with wsjt-x and wspr thanks to previous answers from you fellows. No there are some matters I would like to solve, I know this is very simple for you, and that is why I ask first in stead of going right into experiments.

I have got several SDR's lFiFi SDR, Softrocks of different models, FCDP+. I would like to be able to select which one of them I have connected when starting the Quisk. That means that there will be different config files to select. I think I have seen this done somewhere but cant remember. (I'm 72, yes)

I am also hoping to be able to run several instances of Quisk on the same computer with different hardware and multi instances of the wsjt-x software. Now I am using localhost:4575, so I guess I could set the different instances up with 4576 4577 etc ?

Some short comments on this from one ore more of you will take me faster to good results.

In advance, thank you!

>I have got several SDR's lFiFi SDR, Softrocks of different models, FCDP+. I would like to be able to select which one of them I have connected when starting the Quisk.

There will soon be a new feature to handle this. For now you need to have multiple config files that you start like this:

```
python quisk.py -c config1.py
python quisk.py -c config2.py
```

Hi,
I often used ghpsdr3-Alex in these last years, with a remote softrock SDR through a good wifi link between my 2 locations - Sometimes, through internet also, but this mode is not allowed in France. The quality of the audio (RX & TX) was pretty good.
With the Hermes-lite hardware, using the same wifi link , RX was not possible, the bandwith between the client and the HL server seems to be to big for my wifi link. Also, tested on the local LAN network, the audio report was not good on the air, like if there was no control level of the audio in the HL server part.
I now use only quisk with the wonderfull HL hardware project.

Hello Pascal ... funny you said that ..

iv stopped using ghpsdr3-alex simply because there was some audio level bug with Tx and never could demodulate FM over the nextwork ....

Now has been mostly just Quisk .... HF & VHF ... just got some nice looking BPF for 2M 1.25M and 70cm im looking forward to putting on a spectrum analyser and verify the specs !!!

Hi Sid, Pascal and Mike,

Thanks for your replies regarding remote control of an SDR. Thinking about it over the past few days, my conclusion is that Quisk seems to offer a good solution as it is, althogugh some (ethernet)bandwidth reduction may be possible using IP compression techniques like LZ4, LZO, etc. Reduction of bandwidth would make it easier to get internet access.
As I need to transfer a lot more data (Frequency, PA, ROTOR control, etc.) I'll have to write software anyway. Programming an ODROID will be a new challenge!

Hi Peter,

i would be interested in your solution wrt Rotor. Recently i saw some solution controlling a rotor connected to hamlib via a browser. Just do not rememeber who was the author. For PA forward/reflection measurements there was some discussion few months ago. I think a AVR-NetIO was used there. I assume its also possible to use a Odroid for that task. For CW keying the Odroid is useful anyway.

I wonder if its feasible to implement a dedicated interface between the signal processing part of Quisk and the GUI part so that the GUI can run on a different machine than the signal processing core like its done in ghpsdr3. The alternative could be to have a local copy of Quisk that attaches and controls a remote copy of Quisk like DL2STG does with his Qsdr software.
You could also try to run Quisk on the remote machine just by forwarding the display of this machine in some compressed format. Forwarding audio should be feasible too. I never tried that and teh whaterfall might react slow.

regards

1891. RE: [n2adr-sdr] audio latency with digital modes - stuttering audio

Yahoo group: n2adr-sdr
Date: 2015-11-18 23:02:34 UTC
From: michael.hartje@...
Topic: 1823 Message: 1891

hello Eric, Mike and others on the list,

It took a few days before I had the time to check out Eric's proposal. (comment line 516 in sound_pulseaudio.c)

I tried it and in deed, it results in a better continuous streaming of the audio.

The most important step was to switch off the "open" pavucontrol -- this helps a lot.

Eric mentioned as well, that unbuntu pulseaudio has now a version 4+. -- with my old linux mint 13 it was version 1.x .

The last days I upgraded my old laptop to linux mint 17.1 (ubuntu trusty) and now stuttering disapeers under my circumstances (48 kHz), old laptop. Pulseaudio version is now 4.+

With 48 kHz sample rate "top" shows the cpu load:
quisk: 60%, pulseaudio: 16%, wsjtx(in wspr-mode) 5-7% and parallel fldigi also a few %

I made some experiments with the pulseaudio daemon.conf and found out:
the default-sample-rate is best set to the same sample rate used by the IQ-radio-sound card. Though no sample rate conversions are needed. This lowers the cpu load to the above reported values.

When I use a computer with more cpu-power, there was no stuttering.

But increasing the sample rate to 96 kHz didi not work for me with the old laptop and all software on it. -- this results in pauses in audio stream. (may be I did not made enough experiments with the parameters of daemon.conf.

But my solution was a remote application:

Softrock--compu1-- lan --compu2 -- quisk

The softrock could be driven as a remote TRX and pulseaudio transfers the IQ-samples to a remote controler (compu1). The quisk is used at any place in the LAN (compu2). -- This is a possible use of 96 kHz IQ-signals. The cpu load for the softrock computer (compu1) is quiet low and no stuttering appeers with a more powerful desktop/laptop as a quisk-computer (compu2)

@ Eric: you hint "comment out line 516 in sound_pulseaudio.c" was helpful; it reduces the increasing latency and results in less stuttering.

To finish this thread: Thanks to Eric, and thanks to others who came up with helpful discussion.

pulseaudio version 1 had many problems, anything version 2 and later has
been OK.
Ubuntu 14.04 is at version 4.0, Ubuntu 15.10 is at version 6.0,
openSUSE version 7.1.

My pulseaudio settings are optimized for ghpsdr3-alex and hold good for
all apps including quisk on Raspberry PiB & Pi2, ODROID-C1 & -U3 and x86_64.

1893. Quisk 4.0.0

Yahoo group: n2adr-sdr
Date: 2015-11-20 20:28:16 UTC
From: jahlstr@...
Topic: 1893 Message: 1893

This is a major new release of Quisk. Comments, suggestions and bug reports are welcome. There is a lot of new code here, but remember that the prior version is still on my web page.

Quisk now has two new screen layouts. The "large screen" layout is the default, and is designed for PCs. It uses the full screen width in order to show as wide a graph as possible, and to make mouse tuning easy. The new layout "small screen" is designed for small screens such as touch screens used for single-board computers. But "small screen" can also be used by those with sight impairment, or by those who run Quisk at narrow widths on a PC. It has more button rows; and the band, mode and screen select buttons are hidden behind three master buttons. To select the band, for example, you press the band master button, and a list of bands pops up; then select the band. Press the Help button to read the new help file. Set button_layout = "Small screen" in your config file; but see below.

If you have written your own quisk_widgets.py file to add custom widgets to the bottom of your screen, you will need to change this file to accommodate both layouts. See n2adr/quisk_widgets.py and hermes/quisk_widgets.py for examples.

Quisk now has configuration screens to display and edit its settings. For most users, this makes config files obsolete. Press the Config button and see the additional tabs, and be sure to read the config help tab. Furthermore, Quisk can save different settings for different radios. For example, you can have a block of settings named HiQSDR and a separate block named SoftRock. When Quisk starts, it can ask which radio you want to use. This feature should appeal to those who have trouble dealing with config files, and to advanced users with multiple radios.

If you do nothing, Quisk operates as before, and the settings feature does nothing. You have to turn it on by making a named block of settings; a "radio". If you make some changes that cause Quisk to fail to start, just start Quisk with the "-a" or "--ask" option, and specify "ConfigFileRadio" as the startup radio. The "ConfigFileRadio" is the radio as specified in the config file, and no internal settings are used. This should not happen, but the code is very new, and I expect that it needs more work.

The settings screens take the place of config files, although config files can still be used. After editing settings, it is necessary to restart Quisk to make the settings happen. Press the "Restart" button. Some changes will always require a restart, such as the button layout. But I expect to make many settings happen instantly without a restart.

Jim

Topic: 1893 Message: 1894

Hi Jim,

Many thanks for the new version with all the great features, you have been a busy lad. I am going through the installation and will record any issues as I come to them so there may be several posts over the next few hours or maybe none :-)

First issue is the help files are flagged as executable, I assume to read them from within Quisk but I have not got there yet. Simply double clicking the file from a file manager won't open them like ver 3.7.8, users will need to explicitly need to put in the path in the web browser "file:///home/gvj/Programs/quisk/docs.html" in my case.

Quisk compiles and runs on the old settings without issues. Look for the neat little sliders beside the IMD etc. buttons guys. I note that the agc slider is a little bit narrow Jim and is just starting to trim the level value.

Off to explore further, Again thanks for this Jim, you have gioven me so many hours of pleasure.

Hi Jim,

A further update on installation testing

Audio output seems much less than previous version.
CW sidetone level disproportionately high compared to AF out

Get a startup error as follows ...
Exception in thread Thread-2:
Traceback (most recent call last):
File "/usr/lib/python2.7/threading.py", line 810, in __bootstrap_inner
self.run()
File "./dxcluster.py", line 91, in run
self.telnetConnect()
File "./dxcluster.py", line 111, in telnetConnect
self.tn.write(conf.user_call_sign + "\n")
File "/usr/lib/python2.7/telnetlib.py", line 279, in write
if IAC in buffer:
UnicodeDecodeError: 'ascii' codec can't decode byte 0xff in position 0: ordinal not in range(128)

In Config/Radios "Restart Quisk" remains greyed out even after editing options in my current radio file or creating a new one and I need to exit and reload Quisk to get changes (like changing split mode audio etc.)

Just a heads up at this stage but using pulse (not tried yet on alsa), when recording audio on a QSO, the playback to the other station is garbled and distorted on ver 3.7.8 and appears to be the same on this version too. Will follow up when I test the alsa sound.

Only tried it on the ODROID-U3 with Hermes-Lite.

Audio needed the volume adjusting using pavucontrol.

Apart from the usual alsa and bt_audio stdout messages (noise), no errors.

Started with "python quisk.py" AOK.

Config --> Radios
When Quisk started with the radio --- ConfigFileRadio

I have a second Hermes-Lite I added.
Both with addresses via DHCP 192.168.10.229 and 192.168.10.227.
"Add a new radio with general type --- Hermes v and a name the new
radio MyRadio Add"

Set the IP address of MyRadio to 192.168.10.227, both to use the same
pulseaudio devices.
Killed and started up "python quisk.py", chose MyRadio.

It comes up with ConfigFileRadio tab missing, replaced by MyRadio with
the original IP address of 192.168.10.229 instead of the 192.168.10.227
I set when I added the other Hermes-Lite.

I tried again adding Hermes named HL227. It appears in the Config tab.
Under Radios I have "Ask me" and HL227 appears on the Delete line.

Restart Quisk is greyed out, killing and starting quisk, selected HL227.

MyRadio and HL227 are there but no IP address for HL227.

quisk always starts with the the IP address of MyRadio although HL227 is
selected.
73 ... Sid.

1898. Re: Quisk 4.0.0

Yahoo group: n2adr-sdr
Date: 2015-11-21 17:04:00 UTC
From: g0izm@...
Topic: 1893 Message: 1898

I'm seeing something strange: when I start this version I get a burst of received audio that fades to silence over the period of a second or two. After that it stays quiet as if it's been muted (which it hasn't).

Pulseaudio settings look OK & I've made no changes to the config file or altered any configuration settings.

Any ideas?

73 Ian

Hi Jim,

Just to summarize and add a couple of others ...

1. Using pulse the audio levels are very low and needed to be set with pavucontrol to maximum for a comfortable listening level. Of course everything else on the machine is too loud.

2. The config file copies over to another file and I have tested and made several copies with different names and deleted them with 2 problems ...
2a. The DX cluster does not work from any of them with the error on loading I posted in my previous message. I made 2 renamed copies of my config file and checking in the quisk_settings.json file for all instances of dxCl every one matched the config ones with the last set of readings being the config ones.
gvj@gvj-Mint ~ $ grep -H 'dxCl' quisk_settings.json
quisk_settings.json: "dxClExpireTime": "20",
quisk_settings.json: "dxClHost": "zl2arn.ath.cx",
quisk_settings.json: "dxClPort": "7300",
quisk_settings.json: "dxClPassword": "None",
quisk_settings.json: "dxClExpireTime": "20",
quisk_settings.json: "dxClHost": "zl2arn.ath.cx",
quisk_settings.json: "dxClPort": "7300",
quisk_settings.json: "dxClPassword": "None",
quisk_settings.json: "dxClExpireTime": "20",
quisk_settings.json: "dxClHost": "zl2arn.ath.cx",
quisk_settings.json: "dxClPort": "7300",
quisk_settings.json: "dxClPassword": "None",
2b. The last line in the "Start Quisk with this radio" selection box is always partially obscured i.e. the window does not grow enough to fit in the last line although it does expand to fit extra lines of radios.

3. I lost my favourites and would like to know where Quisk defaults to as I have an old copy of "quisk_favorites.txt" which I would like to put in the default position.

4. When replaying a recording made from the record button on the top row of buttons, it does not replay correctly when using LSB as the audio is inverted. When replaying on usb everything is normal. This fault occurred in previous versions and I suspect is part of the pulse audio changes.

On the "it works perfectly scene" I have tested Quisk on an SSB QSO, CW, JT65, WSPR all with HiQSDR and they are all just great. I have yet to test Hermes-Lite and possibly others will beat me to it.

Great job and I am amazed at how few issues there are for a major release.

Pulseaudio levels seem fine on both my machines here (Mac OSX and Ubuntu 14.04). I'll do more looking tonight or tomorrow to see if anything upstream of pulse audio could have changed. It appears to be reading in my old config file and populating the options.

OK: I've got it going ... but I don't really know how.

I renamed .quisk_conf.py to move it out of the way & restarted Quisk a few times. After some pretty random messing around with the Config button the audio eventually reappeared: I then reinstated .quisk_conf.py & again restarted Quisk and it's still OK. Audio levels seem to be as before, RX & TX both working.

The only problem I have now is that I have to press the Config button twice before getting to the actual settings. On the first press I get a popup window titled "wxPython: stdout/stderr" that reports:

```
Traceback (most recent call last):

SetSizeHints
return _core_.Window_SetSizeHints(*args, **kwargs)
wx._core.PyAssertionError: C++ assertion "(minW == wxDefaultCoord || maxW ==
wxDefaultCoord || minW <= maxW) && (minH == wxDefaultCoord || maxH == wxDefaultCoord ||
minH <= maxH)" failed at ./src/common/wincmn.cpp(1046) in DoSetSizeHints(): min
width/height must be less than max width/height!
```

Not a biggie & maybe just due to my settings. Otherwise this version looks great (thanks for all the hard work!).

Seems to be working fine on my Odroid-x2 ...

Had to sudo make from quisk rather than sudo python setup.py install

odd .. they are the same i thought .. but one would run quisk with not finding ./_qusik.so and the other would ....

Iv not explored much ...

Subject: [n2adr-sdr] Quisk 4.0.0

This is a major new release of Quisk. Comments, suggestions and bug reports are welcome. There is a lot of new code here, but remember that the prior version is still on my web page.

Quisk now has two new screen layouts. The "large screen" layout is the default, and is designed for PCs. It uses the full screen width in order to show as wide a graph as possible, and to make mouse tuning easy. The new layout "small screen" is designed for small screens such as touch screens used for single-board computers. But "small screen" can also be used by those with sight impairment, or by those who run Quisk at narrow widths on a PC. It has more button rows; and the band, mode and screen select buttons are hidden behind three master buttons. To select the band, for example, you press the band master button, and a list of bands pops up; then select the band. Press the Help button to read the new help file. Set button_layout = "Small screen" in your config file; but see below.

If you have written your own quisk_widgets.py file to add custom widgets to the bottom of your screen, you will need to change this file to accommodate both layouts. See n2adr/quisk_widgets.py and hermes/quisk_widgets.py for examples.

Quisk now has configuration screens to display and edit its settings. For most users, this makes config files obsolete. Press the Config button and see the additional tabs, and be sure to read the config help tab. Furthermore, Quisk can save different settings for different radios. For example, you can have a block of settings named HiQSDR and a separate block named SoftRock. When Quisk starts, it can ask which radio you want to use. This feature should appeal to those who have trouble dealing with config files, and to advanced users with multiple radios.

If you do nothing, Quisk operates as before, and the settings feature does nothing. You have to turn it on by making a named block of settings; a "radio". If you make some changes that cause Quisk to fail to start, just start Quisk with the "-a" or "--ask" option, and specify "ConfigFileRadio" as the startup radio. The "ConfigFileRadio" is the radio as specified in the config file, and no internal settings are used. This should not happen, but the code is very new, and I expect that it needs more work.

The settings screens take the place of config files, although config files can still be used. After editing settings, it is necessary to restart Quisk to make the settings happen. Press the "Restart" button. Some changes will always require a restart, such as the button layout. But I expect to make many settings happen instantly without a restart.

Hi Mike,
make just compiles the C files and builds _quisk.so
"python setup.py install" installs stuff in
/usr/local/lib/python2.7/dist-packages/quisk/ and creates the launch
script /usr/local/bin/quisk
73 ... Sid.

Eric, line 516 "read_frames = dev->read_frames;" in sound_pulseaudio.c should that be commented out permanently or is that just for broken audio on relatively narrow wifi networks etc.?

The Audio levels for Digital modes are still the same (and plenty of it) and I now suspect the audio out from Quisk is probably OK. Checking closer I find the audio level on an AM broadcast station to be comparable to audio from a CD and I need the volume slider to be set back to 50% for a comfortable listening level. When listening to CW (at any bandwidth) I need to run the volume slider to full - some hard boiled ssb ops may say my ears are rejecting CW :-) but on my TS-50 the same volume setting is used for CW or SSB and there is not the big difference I noticed on Quisk. My original report was a bit of a red herring as it is really based on perception.

Jim, The shaved off text in the sliders could be fixed by left justifying it.

Often when exiting Quisk I get this message box ...

QUISK version 4.0.0 Capture from UDP 192.168.2.196 port 0xBC77, firmware version 1.87 is not responding.

You may choose to wait a short while for it to continue or force the application to quit entirely.

with a "Force Quit" or a "Wait" button displayed

Going to do the same testing with alsa and then will move on to Hermes-Lite where I have some filter testing to do also. It would be nice when starting Quisk if I could have the alsa loopback to be an option so I can do a menu item of "HiQSDR alsa Loopback" vs "HiQSDR alsa" for when I don't want to do digital modes and want the least resource consumption possible. I'm not sure if a loopback uses anything if it is not passing audio or connected so maybe someone can educate me here and the request may be superfluous.

Please check the dx cluster call sign in your config file and on the settings screen.

Hello Sid,

I am not sure I am following you here. On my config/radios/hardware screen I also have a Hermes-Lite. When I set the ip address to blank and restart, the config/radios/hardware screen shows the blank. When I set an IP address and restart, config/radios/hardware screen shows the IP address I entered. The Hardware screen saves the IP address I entered, either blank or 192.168.1.122.

But there is an issue with the Hermes-Lite. A blank IP address is a valid entry, and means the IP address should be obtained from DHCP. If you enter an IP address, it instructs the Hermes-Lite to use that address instead of DHCP; but I think that that fails on the Hermes-Lite unless a DHCP address has been obtained first.
